River water utilisation	Khan	Positive	Local	Medium	Moderate	Definite	Medium-High
	Swakop	Negative	Regional	Medium	Moderate	Definite	Medium-High

## 7. ACTIONS THAT ARE REQUIRED, WHETHER OR NOT THE KARS PROJECT PROCEEDS

The investigative and communications processes which have been followed during the execution of this assessment of potential impacts associated with the KARS Project have yielded several important insights and findings. Also, many of the mitigatory actions which have been identified as having the potential either to minimize negative impacts or to improve the current situation, could be implemented with immediate effect. All of these mitigatory actions could assist individual landowners, Local Authorities and Government Departments with their efforts to ensure long-term, sustainable water resource management in the West Coast region of Namibia.

Therefore, whether or not the Management of Rössing Uranium decide to proceed with the KARS Project, it is strongly recommended that the following actions should be implemented and maintained. The direct benefits to all stakeholders concerned would consist of the following:

- Increased quantities of water available for utilization along the lower Swakop River;
- Improved ground water quality along the lower Swakop River; and
- Improved understanding and ability to manage the ground water resources of the lower Swakop River.

The essential actions which should be implemented as soon as possible consist of the following, in order of importance or priority:

1. A carefully designed control programme to remove as many alien trees (particularly *Prosopis*) from the river beds of the lower Khan and Swakop Rivers should be implemented. In addition, a proportion (say 50 %) of the dense growths of indigenous *Tamarisk* trees which have developed in the lower Swakop River could also be removed. These dense *Tamarisk* growths have been promoted by the reduced size and number of floods in the Swakop River, due to construction of the Von Bach and Swakoppoort dams.
2. A set of suitably located piezometers should be installed in properly designed water-level monitoring boreholes, at appropriate intervals along the lower Swakop River, to assist with routine monitoring of ground water levels. Ideally, additional piezometers should be installed in the Khan River and Swakop River immediately above the confluence of the two rivers. Water quality samples should also be collected from these boreholes whenever water levels are recorded. Water levels should be recorded at least on a monthly basis and used to analyze ground water contributions from the two rivers, as well as changes in water level depth along the lower Swakop River. The information should be made available to the general public.

3. All stakeholders should contribute to the formal development of an integrated catchment management plan for the Khan-Swakop catchment. Whilst the major responsibility for water resource management in Namibia lies with the Department of Water Affairs, it is essential that every water user group in these catchments contribute to the development, implementation and maintenance of a catchment management plan. This will allow clear and unambiguous decisions to be made as to the best use of an extremely scarce resource.
4. The type of bund design proposed for use in the KARS Project offers a simple yet effective method of increasing the infiltration of surface flood waters into the ground water in the river bed. This technique could be implemented in the lower Swakop River, say between Palmenhorst and Goanikontes, or even further downstream. This would provide water users along the lower Swakop River with an immediate improvement in both the quantity and quality of water available for agricultural use.
5. Farmers along the lower Swakop River should implement improved irrigation techniques (particularly drip irrigation), together with the cultivation of salt-tolerant crops, to minimize the adverse effects of saline ground water.
6. The Swakopmund Municipality should initiate a routine monitoring programme to record the profiles of beaches between the mouth of the Swakop River and the outskirts of Vineta. This will provide firm evidence as to whether or not the beaches are eroding, and the rate of such erosion.

4.6.4 Sand mining activities .....	89
4.6.5 Sand dunes to the south of the Swakop River .....	91
<b>5. EVALUATION OF ISSUES ASSOCIATED WITH THE KARS PROJECT</b> .....	<b>95</b>
5.1 Introduction .....	95
5.2 Categories of issues .....	96
5.2.1 Need and desirability of the project .....	96
5.2.1.1 Impact of the KARS Project on the economic viability of the sea water desalination project at Walvis Bay .....	96
5.2.1.2 Regional water supply and management .....	96
5.2.1.3 Improved knowledge of aquifer functioning and recharge .....	97
5.2.1.4 Impact on water management systems upstream of KARS .....	98
5.2.2 Design and engineering features of the dam and aquifer recharge mechanism .....	98
5.2.2.1 The ideal capacity for the proposed dam .....	98
5.2.2.2 How can the wider public benefit from the KARS proposal? .....	99
5.2.2.3 Can the proposed dam withstand major floods? .....	100

5.2.2.4	Consequences of dam wall failure	102
5.2.2.5	Choice of dam wall design	103
5.2.2.6	Decanting water and infiltration management	106
5.2.2.7	Decommissioning options	108
5.2.2.8	Silt accumulation reduces project lifespan	110
5.2.3	<i>Ecological issues</i>	112
5.2.3.1	Impact on fauna and flora immediately above and below the dam wall	112
5.2.3.2	Impact on fauna and flora along the lower Khan and Swakop rivers	113
5.2.3.3	Loss of rare or endangered species	114
5.2.3.4	Increased spread of alien vegetation	115
5.2.3.5	Loss of dispersion/migration corridor	116
5.2.3.6	Loss of sediments and nutrients to downstream ecosystems	117
5.2.3.7	Elevated erosion rates below dam wall	118
5.2.3.8	Disturbance due to elevated noise and dust levels	119
5.2.3.9	Development of new riparian habitats along shoreline	119
5.2.4	<i>Health and safety issues</i>	120
5.2.4.1	Contamination of ground water by radionuclides	120
5.2.4.2	Contamination of ground water	121
5.2.5	<i>Socio-economic issues</i>	121
5.2.5.1	Aesthetic impacts of borrow areas etc.	121
5.2.5.2	Increased litter and waste around construction site	122
5.2.5.3	Disturbance of local archaeological sites	123
5.2.5.4	Severance of public access to the bed of the Khan River	123
5.2.5.5	Potential changes to the beach front in Swakopmund	124
5.2.5.6	Interruption of sand-mining activities near Swakopmund	125
5.2.5.7	Potential for sand dunes to migrate across the Swakop River into Swakopmund	126
5.2.5.8	Impacts on the quantity and quality of ground and surface water available for downstream users	126
5.3	<b>Socio-economic benefits</b>	128
5.3.1	<i>Improved management and monitoring of area</i>	128
5.3.2	<i>Improved knowledge of aquifer functioning</i>	129
5.3.3	<i>Improved conservation of existing water resources</i>	129
5.3.4	<i>Improved recreational opportunities</i>	130
5.4	<b>Financial viability of the KARS project</b>	130
5.5	<b>Summary of issues and anticipated impacts</b>	131
5.6	<b>Outline of possible mitigatory actions</b>	132
6.	<b>SUMMARY OF IMPACTS, MITIGATORY ACTIONS AND FURTHER RECOMMENDATIONS</b>	135
6.1	<b>Key impacts and issues of concern</b>	135
6.2	<b>Proposed mitigatory actions and recommendations</b>	135
6.2.1	<i>Develop an Environmental Management Plan</i>	138
6.2.2	<i>Additional aquifer recharge in the lower Swakop River</i>	138
6.2.3	<i>Ground water quality - lower Swakop River</i>	138
6.2.4	<i>Coastal and beach erosion</i>	139
6.2.5	<i>Riparian vegetation</i>	139
6.2.6	<i>Water use in the lower Swakop River</i>	139
6.2.7	<i>Sand mining</i>	139
6.2.8	<i>Erosion at the KARS dam site spillway</i>	140

6.2.9	<i>Recreational access in the Khan River</i>	140

Appendix 6	Fluvial and Aeolian Coastal Sedimentation Processes and Their Relation to the Condition of the Swakopmund Beaches and the Encroachment of Dunes from the South Towards Swakopmund. Division of Water, Environment and Forestry Technology, CSIR, Report No. ENV/P/C-97216, 11 pp.	R. Meyer September 1997
Appendix 7	Technical Details of Borrow Areas and Proposed Techniques for Construction of Ground Water Flow Retarders. Metago Environmental Engineers. 4 pp.	G. McPhail November 1997

## ACKNOWLEDGEMENTS

The Project Team could not have completed this study without the active and enthusiastic participation and support of all the Project Team members. Mr Brian Gibson, of Brian Gibson Issue Management (BGIM) facilitated the public meetings and ensured that the communications process was closely adhered to throughout the Project.

Particular thanks are owed to Mr Rainer Schneeweiss (Superintendent: Environmental Geology) and Mrs Sandra Kehrberg (Geohydrologist), both from the Rössing Mine, for providing detailed technical information on the routine monitoring programmes that Rössing carries out in the Khan River. Rainer Schneeweiss and Anna Fry also produced several of the maps which have been used in this Report.

The KARS Project Leader was Mr Brendan Hammond, Manager: Processing and Production at the Rössing Uranium Mine. Both he and Mr Werner Haymann, (General Manager: Operations), are thanked for their continual support to the Project Team. Mrs Carol Musiol and Mrs Maggi Barnard are sincerely thanked for their assistance with logistical arrangements and communications, respectively.

Mr Ben Hochobeb, Manager of Rössing's Environmental Services, actively participated in discussions and contributed advice and information to the Project Team.

The KARS Working Group was composed of members elected by the local community in Swakopmund. The members were: Mr E. Demasius, Mr E. Miller, Mr L. Hesse, Mr T. Tirronen and Mr P. Hamman. Rössing Mine was represented by Mr B. Hammond and Mr R. Schneeweiss, while Mr B. Gibson acted as facilitator. All these members of the Working Group are sincerely thanked for their participation and for the many constructive suggestions that were made to the Project Team.

In Namibia, two External Evaluators were appointed to provide an independent assessment of the investigation process followed by the Project Team, as well as the technical competency and validity of their findings. Special thanks are therefore due to:

Dr M.K. Seeley	Desert Research Foundation of Namibia, and
Mr P. Tarr	Ministry of Environment & Tourism, Windhoek.

Both Dr Seeley and Mr Tarr examined the documentation developed from this project and made detailed constructive suggestions for improving a draft of this report.

Several staff members of the Namibian Department of Water Affairs provided technical information and copies of internal Departmental Reports, or participated in the public meetings held at Swakopmund, Arandis and Usakos. Special thanks are due to:

Dr S.J. De Wet	Deputy Director: Water Environment Division
Mr G. Van Langenhove	Deputy Director: Hydrology Division
Ms A. Eggers	Geohydrologist: Hydrology Division

Special thanks are due to the individuals and representatives of several organizations in Namibia who contributed advice and detailed information to members of the Project Team.

Several land-owners and farmers along the lower Swakop River kindly made time available to discuss their concerns with the Project Team. In particular, special thanks are due to the following: Mr B.W. Fleischmann, Mr L.E. Pohle, Mr E.A. Putzier, Mr J. Van Heerden, Mr C.B. Botha, Mr B.H. Hoppe, Mr H.H. Schreiber, Mr D. Godfrey, Mr S. van Niekerk and Ms C. Lees.

Mr Lorenz Hesse deserves special thanks for the way in which he provided Team members with invaluable advice and information during our visits to the Swakop River smallholdings and farms.

1. INTRODUCTION AND BACKGROUND INFORMATION

Namibia is a very dry country with low rainfall and high evaporation rates. Rainfalls are erratic, unevenly distributed and often localized in extent; average annual rainfall varies from some 25 mm/year over the coastal Namib Desert to around 700 mm/year in the north-eastern Caprivi Region (Figure 1.1). Potential A-pan evaporation rates can exceed 3,800 mm/year in the interior of the country though they usually drop below 3,000 mm/year in the coastal zone (Crerar & Church, 1988). This excess of evaporation over rainfall leads to a marked water deficit in all months of the year and droughts are a common occurrence (Heyns, 1992).

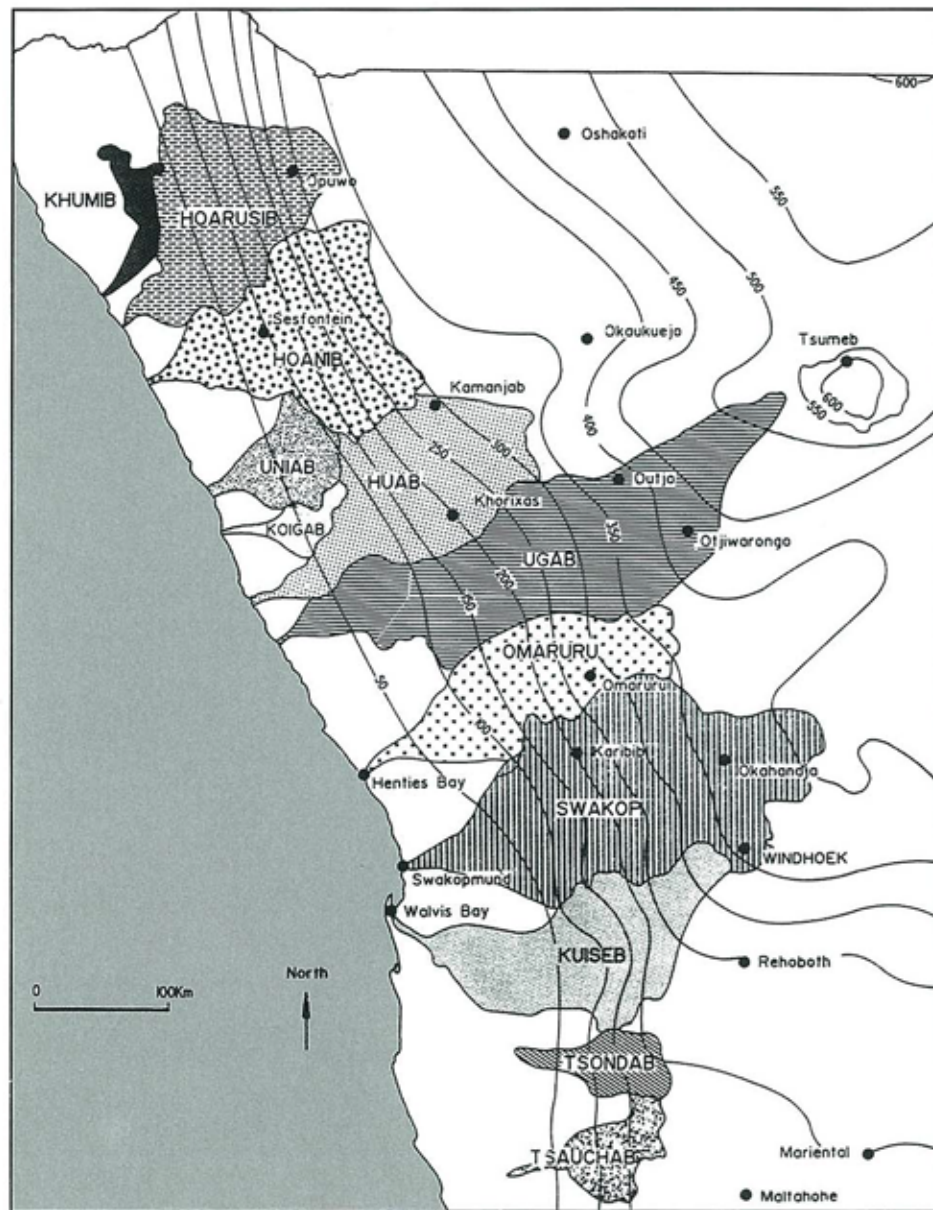

Figure 1.1: Average annual rainfall isohyets over north-western Namibia.

Surface runoff is both erratic and sporadic, following seasonal rainfalls. The rivers in the interior of Namibia are episodic or ephemeral rivers that flow only after good rains in their catchment areas (Jacobson *et al.*, 1995; Bethune, 1996) (Figure 1.2). Most of these rivers are westward flowing, such as the Kuiseb, Swakop and Omaruru Rivers, and serve as life-giving linear oases in the otherwise dry Namib Desert. Namibia is characterized by an almost complete lack of perennial rivers or other perennial surface water resources, except for the Orange River along its border in the south and the Kunene, Okavango, Kwando, Linyanti/Chobe and Zambezi rivers on its northern borders (Heyns, 1992; Bethune, 1996).
