

SUMMARY OF THE 1984/85 BASELINE BIODIVERSITY SURVEY OF THE RÖSSING AREA, CENTRAL NAMIB DESERT

J. Irish

1. INTRODUCTION

Rössing Uranium Ltd. (RUL) sponsored an environmental survey of the Rössing Mine area under the auspices of the State Museum in Windhoek (now the National Museum of Namibia), in 1984/85. An impressive amount of information was collected, but due to factors prevalent at the time, no concerted effort to collate or summarise it was ever made. In the context of the current work, the need for baseline environmental data both for the areas to be mined and those surrounding them, prompted this effort to bring together the 1980's information in one place.

Negotiations and planning for the survey commenced in mid-1983, and a visit to the area took place on 20 September 1983. The museum files include a draft project proposal dated 24 November 1983. The survey formally started on 12 March 1984. From then, site visits were made and traps serviced at four-week intervals throughout 1984. The initial plan was for the project to run for 18 months. Within the first 3 months, however, staff changes at both the Museum and RUL had delegated bilateral project responsibility to uninvolved individuals. Project participants were left without oversight, guidance, or recourse. Most continued regardless, out of scientific curiosity, but by the end of 1984 the project had mostly petered out. The invertebrate traps were active till 7 May 1985, when problems with RUL security blocking access to the two secondary sampling sites prompted termination. The reptile trap survey was stopped soon after on 13 June 1985. There was no formal overall project termination date. Most participants did submit reports to RUL, and these are still on file there, but they were disjunct, individual efforts.

Sources of information for the current summary included:

- unpublished data on file at the Museum
- reports submitted to RUL on file at RUL
- unpublished data in the possession of individual scientists
- information on specimen labels in the museum collections
- incidentally published information

Disciplines involved in the survey were:

- Arachnology (eight-legged invertebrates)
- Botany (plants)
- Entomology (six-legged invertebrates)
- Herpetology (reptiles and amphibians)
- Limnology (water biology)
- Mammalogy (mammals)
- Ornithology (birds)

More information on each follows later.

2. SAMPLING SITES

There were six fixed sampling sites where traps were deployed on a regular or continuous basis, depending on the discipline. Selection of the sites was based on an experimental design intended to test the effects of the two main environmental impacts of concern at the time, namely windblown dust and raised groundwater levels originating from mining activities. Because of the long time span since, data gaps, and data inconsistencies between different disciplines, it would be very difficult indeed to today test these hypotheses using 1980's data, and it will not be attempted here. The current report takes the conservative approach of attributing observed differences in biodiversity between sites primarily to habitat differences between sites. The data remains eminently useful as a biodiversity baseline without attributing causality to such differences.

The locations of sites are mapped in Figure 1. Since the project predates the availability of GPS's, the opportunity was used in 2007 to relocate and GPS-reference the fixed sites (Table 1).

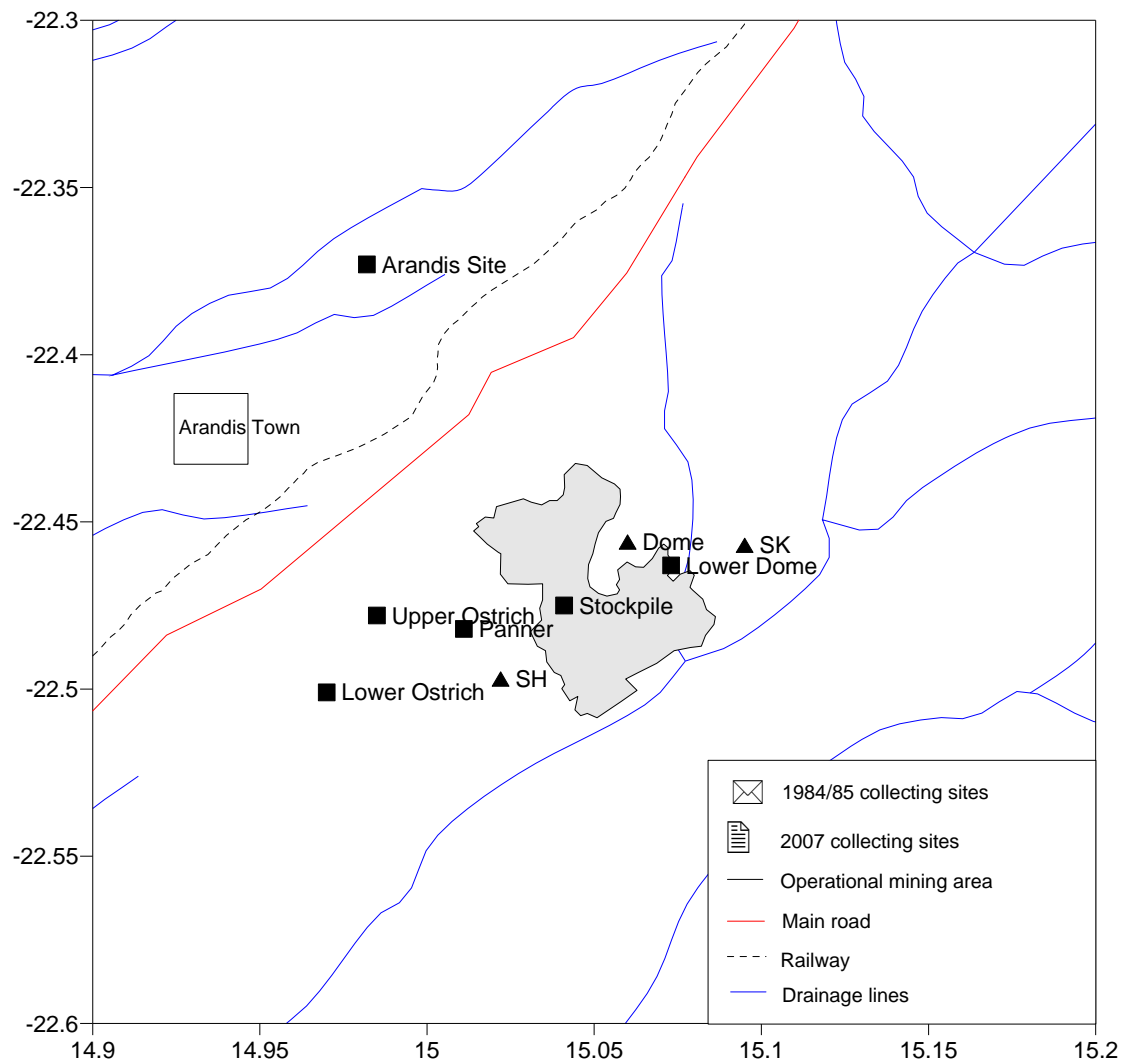

Figure 1. Location of the 1984/85 fixed collecting sites in the Rössing area, with 2007 sites for comparison.

Table 1. Coordinates of central points in each fixed trapline.

Site	Longitude °E	Latitude °S	Notes
Upper Ostrich Site	14.985	-22.478	GPS
Arandis Site	14.982	-22.373	GPS
Panner Site	15.011	-22.482	GPS
Lower Ostrich Site	14.970	-22.501	Site destroyed, GPS adjacent
Stockpile Site	15.041	-22.475	GPS
Lower Dome Site	15.073	-22.463	Site destroyed, map estimate

At each of the four primary trap sites (Upper Ostrich Site, Lower Ostrich Site, Panner Site and Arandis Site), five parallel trap lines were deployed (Figure 2). Trap lines were surveyed with the aid of a steel tape measure and dumpy level, and each trap node was marked with an iron peg. Many of these pegs remain *in situ* today. Three of the five lines were for mammal traps, one for invertebrate traps, and one for reptile traps. Mammal and reptile traps were deployed only during site visits, serviced daily, and retrieved at the end of the visit. Invertebrate traps contained preservative, so they were continuously active, and site visits served to retrieve the previous sampling period's catch and replace the preservative with clean liquid. At each of the two secondary sites (Stockpile Site and Lower Dome Site), only invertebrate traps were deployed.

More information on each of the individual sites follow.

Upper Ostrich Site

Situated southeast of Arandis Airport, in the upper reaches of the Ostrich drainage basin. The site was intended to sample plains biota at a location relatively close to the mine and potentially affected by it. Traps were placed 25 m apart, and almost all pegs remain in place today. The site is often referred to as 'Upper Ostrich Gorge', but is on flat ground, not in a gorge.

Arandis Site

Situated about 6 km NE of Arandis town, and often referred to as '6 km NE Arandis', the site was intended to sample plains biota at a location far from the mine and possibly unaffected by it. Traps were placed 25 m apart, and at least some pegs remain in place. Also referred to as 'Arandis Control Site'.

Panner Site

Situated just north of the point where the NamPower line crosses the Panner drainage line. The site was intended to sample drainage line biota at a location that was visibly affected by mining activities. Groundwater levels in the area were raised, but there was no actual open water on site. Traps were placed 15 m apart. A shorter interval between traps was necessary to fit the entire trap line into the available space in the river bed. Despite floods since, a

few pegs remain in place. The site is also referred to as 'Upper Panner Gorge', or simply 'Panner Gorge'.

Figure 2. Generalised layout of typical fixed trapline site. M = live mammal traps, E = invertebrate preservative pitfall traps, R = live reptile traps. Scale in meters. Directionality differs between sites.

Lower Ostrich Site

Situated just north of the point where the NamPower line crosses the Ostrich drainage line. The site was intended to sample drainage line biota in a location unaffected by raised groundwater levels. Traps were placed 25 m apart, but no pegs could be relocated since it has been levelled and is being

used to stockpile granite blocks originating from a nearby quarry operated by Rock Africa. The site is also referred to as 'Lower Ostrich Gorge'.

Stockpile Site

Situated immediately west of the Coarse Ore Stockpile. The site was intended to sample the fauna of a rocky ridge that was visibly impacted by windblown dust originating from the stockpile. Only invertebrate traps were deployed here. For consistency with the previous sites, nine traps were placed 25 m apart, in a relatively but not absolutely straight line following the contour of the ridge. Some pegs remain in place. The site is also referred to as 'Stockpile Ridge', 'Primary Crusher Dust area', or simply 'Rössing Mine'.

Lower Dome Site

Situated adjacent to Lower Dome Gorge. The site was intended to sample the fauna of a rocky ridge that was less visibly impacted by windblown dust. During the course of the project it became clear that the site did receive its share of dust fallout from blasting in the adjacent open pit, but dust deposition was not at the same intensity as at the Stockpile Site. Because of the exceedingly rocky substrate, regularly spaced traps as at the other sites proved impractical here. Only six traps were deployed. One trap was placed on the summit and one at mid-height on each flank of each of two parallel ridges. The placement of individual traps was determined by substrate conditions, i.e., traps were placed wherever it was possible to dig a large enough hole, as close as possible to a straight line perpendicularly across the ridges. The particular area was selected because we were told during the planning phase that two adjacent ridges there had different levels of natural background radiation, and we saw this as an opportunity to also test whether that affected the fauna. At project start, it proved impossible to find anybody able to point out which particular ridges had been meant. Because of this, traps were only deployed at Lower Dome during the third trapping period, and even then we had no way of knowing whether the traps were placed on ridges with different radiation levels, or not. Because of the project management vacuum that had developed by this time, no further information on location or radiation levels could be gained. With hindsight, the initial indication probably referred to parallel ridges of alaskite and country rock. Today the site has been at least partially covered by waste rock dumps. Only invertebrate traps were deployed at Lower Dome. The site is also referred to as 'Lower Dome Gorge', or simply 'Dome Gorge'.

Limnological sampling sites

The limnological equivalent of the fixed survey sites above was a program of repeat sampling at the following seven water bodies.

- Arandis pools. Bulldozed holes in watercourse south of Arandis town.
- Boulder Gorge. South of Tailings Dam.
- E camp. Location unknown, suspected west of Tailings Dam.
- Fish Pond / Pinnacle Gorge. South of Tailings Dam.

- Panner seepage. Upper Panner Gorge, originating from Tailings Dam, exact location unknown.
- Piet se gat (a.k.a. Rock Fountain). Adjacent to Panner Gorge, at 15.0198°E, 22.492°S.
- Pinnacle Pond. South of Tailings Dam. 15.035°E, 22.4777°S.

Ad hoc sampling

In addition to fixed sampling, all participants did *ad hoc* sampling and made observations throughout the area, but only Entomology followed a structured sampling programme. They selected an area around the mine and divided it into 16 squares, each square measuring 5 x 5 geographical minutes (Figure 3). Each square was visited and sampled at least once during the project period.

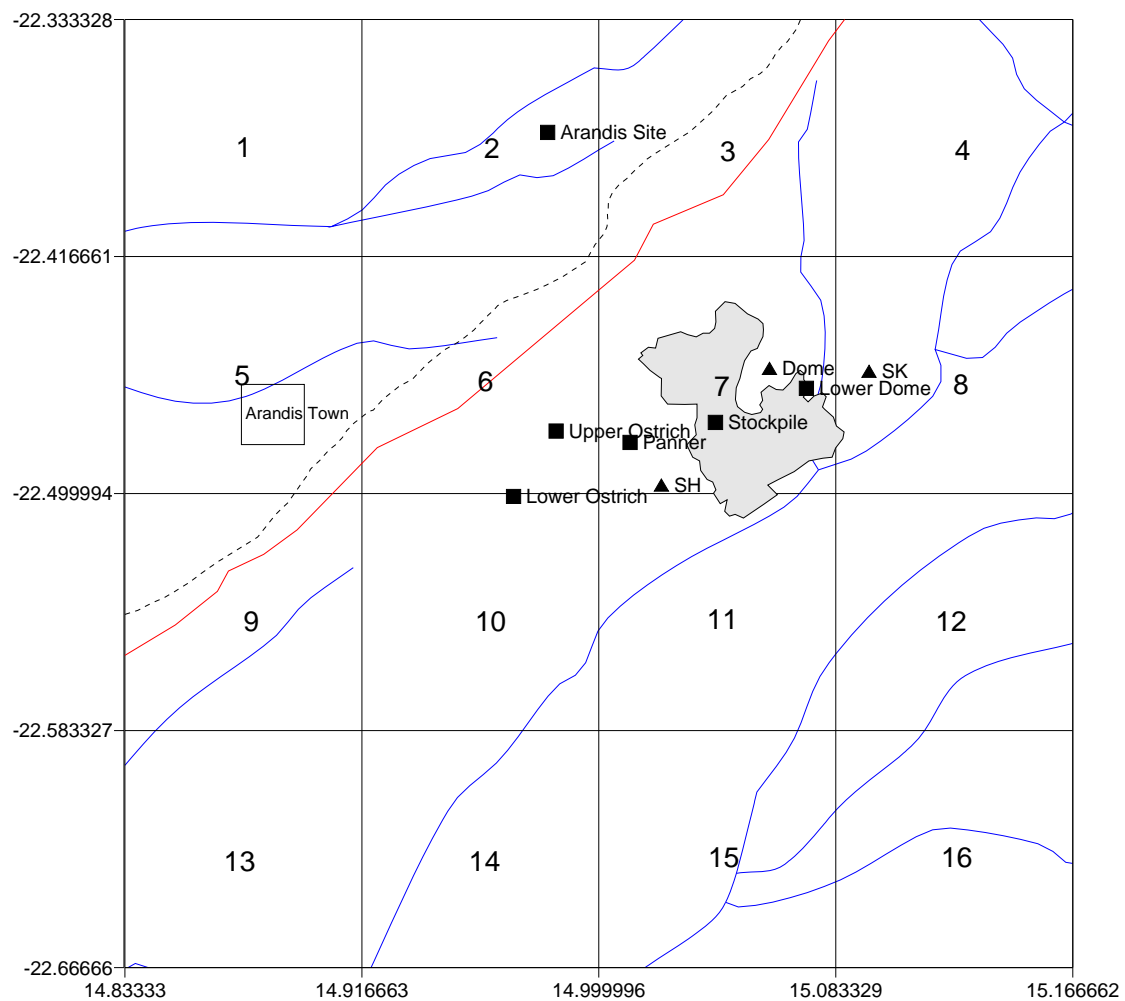

Figure 3. Collecting blocks for wider entomological survey.

3. INDIVIDUAL DISCIPLINES

Arachnology

Terrestrial non-insect invertebrates (spiders, solifuges, scorpions, mites, myriapods, etc.) were treated by the Museum's Curator of Arachnology, Eryn

Griffin. A major source of arachnid material was the preservative pitfall traps run by Entomology, and this was supplemented by *ad hoc* handsampling throughout the area. Mrs. Griffin is currently based in the United States and is no longer active in arachnology. She declined involvement with the current work, but allowed us to use whatever of her work we could find. Original handwritten identification sheets of pitfall trap material was available on file at the National Museum, and this was crosschecked for consistency against the collection database.

Eryn gave a talk on her work at an arachnological meeting (Griffin 1986), wrote two popular accounts based in part on this project (Griffin 1987, 1989), and published two scientific papers based on the material (Griffin 1990; Platnick & Griffin 1990). Collected material was also studied by other scientists: Griswold (1987), Dippenaar-Schoeman (1990), Jocqué (1990a), Starega (1992), Szütz & Jocqué (2001), Prendini (2003, 2004, 2005), Van Niekerk & Dippenaar-Schoeman (1994), Foord (2005) and Platnick & Bird (2007). The latter, published in January this year, is indicative of the fact that a full study of the material collected by the Rössing project is nowhere near complete.

Botany

Since the Museum had no in-house botanical expertise, survey work was contracted out to a consultant from Omaruru, Patricia Craven. Mrs. Craven declined involvement with the current work. At the time she accompanied other participants during sampling, collected plants and made notes. The RUL files include a document on plants (Anon, no date, a), that probably represents the results of this work. An additional source of information for the current report was a database query of specimen holdings in the National Herbarium in Windhoek. It includes a total of 1602 records from the area, of which 346 were collected by Craven.

Entomology

Terrestrial insects were treated by the Museum's Curator of Entomology, John Irish, and Assistant Curator Hella Rust (née Liessner). The main source of information was a preservative pitfall trap survey that ran for 60 weeks. Though all trapped insects are preserved in the Museum, only apterous (flightless) insects from the pitfall traps were treated in detail, since pitfall traps only trap flightless insects in statistically comparable way. Alate (flying) insects were to have been sampled by a mechanical rotary trap built by RUL, but that only functioned for a few hours before breaking down. It was never fixed or used again, explaining the lack of detail available for alate insects. Extensive handsampling was also done throughout the area to supplement trap results.

The main source of information for the current report is Dr. Irish's handwritten notes from the time, which relate almost exclusively to flightless pitfall trap material. Since the Museum insect collection is not computerised, there is no simple way to extract information on either the flighted insects captured in pitfall traps, or the handsampled material from the 16 blocks (fig. 3). At the

time, collected specimens were sorted into morphospecies (i.e, things that look alike and are probably the same species), and numbered from 1 onwards. As the project progressed, the help of expert taxonomists were solicited to put proper species names to these morphospecies. In some cases original taxonomic research was done to identify particular groups. Where there are gaps in the numbering today, these reflect cases where subsequent identification by experts, or our own experience as the survey progressed, indicated that what we had been distinguishing were in fact one species. A voucher collection of these morphospecies was maintained at the time, and should still be in the Museum. Neither the main collection nor the vouchers were accessible to us during the current work. Many insect species remain unidentified.

Small numbers of insect specimens that fell into reptile traps, that were encountered during arachnological handsampling, and that colleagues came across in the course of their work, were also incorporated into the collection. Wherever notes of these survived, they were incorporated into lists below.

Preliminary results were compiled into an unpublished report to RUL by Irish (1987b). Popular accounts of the work were published by Irish (1984) and Irish & Liessner (1985). Material from the Rössing Project was published on by numerous experts, including Holm (1985, 1986a, 1986b), Irish (1986, 1987a, 1988a, 1988b, 1988c, 1992), Scholtz & Howden (1987), Wittmer (1988, 1989), Eardley (1989, 1991a, b), Marais & Holm (1989), Penrith & Endrödy-Younga (1994), Gussmann (1995), Greathead (2000), Bologna *et al.* (2001), Hancock *et al.* (2001), Irish & Roberts (2006) and Kurahashi & Kirk-Spriggs (2006).

Herpetology

Reptiles were treated by the Museum's Curator of Herpetology, Hartwig Dell'Mour. Dr. Dell'Mour is currently based in Austria and no longer professionally active in herpetology, but he kindly provided information and allowed its use here. The main source of material at the time was a series of pitfall traps at the four main sampling sites. Reptile traps were only deployed during site visits, and captured specimens were released after identification, so that material today in the Museum collections are mostly from handsampling in the area. A small number of reptiles drowned in invertebrate traps, and were also incorporated into the collections.

The main sources of information for the current report were copies of field notes and reports provided by Hartwig, updated information on distribution and conservation status provided by Mr. Mike Griffin (Ministry of Environment and Tourism), and a few queries on particular species from the museum's herpetological database.

The discovery of the Husab sand lizard (*Pedioplanis husabensis*) is closely linked to the Rössing project (Berger-Dell'Mour & Mayer 1989).

Limnology

Aquatic invertebrates were treated by the Museum's Curator of Aquatic Biology, Charmaine Meyer. Charmaine is known to still be in Namibia, but is no longer professionally active, and could not be traced with regard to the present study. For any biota that she could not identify herself, Charmaine solicited the help of a more experienced limnologist, Prof. Jenny Day from the University of Cape Town. Jenny informed us that the bulk of the Rössing survey material is still at UCT, and has still not been identified.

Most limnological material came from handsampling by Charmaine, from the seven repeat sites mentioned above, as well as at *ad hoc* waterpoints elsewhere. Information for the current report came mainly from unpublished notes and correspondence on file in the (vacant) Aquatic biology section at the Museum, and material on file at RUL. Despite reference in the files and notes to much collected material, the Museum's Aquatic Biology database includes only 7 specimens from Rössing, the rest is assumed to be in Cape Town. A problem with all of the above is that species and localities are often indicated by codes, the meaning of which is unknown (B1, B3, L5 etc).

Not much has been published on the aquatic Rössing material. The summary paper by Day (1990) maps waterpoints at Rössing, and is probably partly based on Rössing material, but includes no actual site records. Other sources used here include Archibald (1987) and Grichanov (2000).

Mammalogy

Small mammals were treated by the Museum's Technical Assistant for Mammalogy, Brian Colahan. Brian is currently based in South Africa, and kindly supplied information for use here. Most material came from live rodent traps deployed at the four main trap sites during site visits only. Captured specimens were weighed and sexed, and marked before being released again. No specimens were supposed to be killed, except those from the final month. This final killing was never done, though (B. Colahan, pers. comm.), so the museum collection today reflects mainly the few specimens that suffered incidental drowning in invertebrate traps.

Information for the current report comes mainly from Brian's field notes. No published information on the survey could be traced. A listing of additional species either observed in the area, or not seen but expected to occur, was prepared by John Pallett and is included here.

Ornithology

Birds were the responsibility of the Museum's Curator of Ornithology, Joris Komen. Joris is still in Windhoek, but no longer active in ornithology. He declined involvement with the current work, but allowed us to use whatever of his work we could find. Brian Colahan also did an independent bird survey as an aside to his mammal work.

RUL files include a checklist for the area prepared by Joris. Brian's work was published as Colahan (1987). A listing of additional species either observed in the area, or not seen but expected to occur, was prepared by John Pallett and is included here.

General assessment

Consideration of the published literature based on the Rössing material as enumerated above indicates a slow but steady stream of new invertebrate species described over the years, up to and including 2007. This happened despite the fact that there was no active effort by the museum to get Rössing material described – everything happened as a result of individual interest or passive dissemination of material. There are still major invertebrate groups for which the Rössing material is completely unidentified. No doubt many more new species still await description and publication. If the results to date are anything to go by, a significant number of the described species will be Central Namib endemics that are range restricted to the Rössing area.

4. TAXONOMIC LISTING

4.1. Mollusca (snails)

Unidentified molluscs are mentioned in the limnological notes. Snails in the Rössing area are expected only near water.

4.2. Crustacea (crustaceans)

Copepoda (seed shrimps) and Ostracoda (mussel shrimps) are mentioned in limnological notes and correspondence. These are all aquatic animals. No further identifications are available.

4.3. Myriapoda (centipedes and millipedes)

4.3.1 Chilopoda (centipedes)

- *Diphtherogaster flavus* is widespread in western Namibia and adjacent countries, and had been recorded from Swakopmund previously (Lawrence 1975). Since this is the only known *Diphtherogaster* species in Namibia, it is assumed that the Rössing material, though identified to genus only, belongs to it.
- *Lamyctes* includes a single Namibian species, but since this has only been recorded from the interior, the Rössing material, which was identified to genus only, may represent either another species or a range extension.
- *Cormocephalus* includes at least 9 Namibian species, of which one, *C. pontifex*, is a central Namib endemic known from Arandis (Lawrence 1975). The Rössing material was identified to genus only, but does not necessarily represent *C. pontifex*, since both *C. multispinosus* and *C. oligoporus* could potentially occur in the area as well.

4.3.2 Diplopoda (millipedes)

Millipedes prefer moister habitats, and none were found in the pitfall traps. However, one *Chilixenus* species was handsampled at the Arandis Site. The current generic assignment of Namibian species previously referred to *Chilixenus* is probably to *Afraustraloxenodes*, of which one species, *A. coineaui* is found in the Central Namib (Duy-Jacquenin 2003), but it is not known whether the Rössing material refers to this.

4.4. Arachnida (eight-legged invertebrates)

4.4.1 Acari (mites and ticks)

The Rössing mites are identified to higher levels only. No detailed information is available, but at least four species seem to be present. The few ticks (Ixodida) found in pitfall traps probably fell from the few rodents that drowned in invertebrate traps. The limnological survey collected water mites from various water bodies.

4.4.2 Araneae (spiders)

4.4.2.1 Agelenidae (funnel-web spiders)

Most Rössing material was identified to generic level as *Agelena* species, but some specimens were identified to family level as Agelenidae only. Since some with only family level identifications in the data sheets are in the museum database with generic identities, it is assumed that all the Rössing Agelenidae material belongs to *Agelena*. Material was also hand-collected from funnel webs in shrubs and among stones around waterpoints. Only one *Agelena* species (*A. suboculata*) is known from Namibia, but it is not known whether the Rössing material belongs to it or not.

4.4.2.2 Ammoxenidae (termite-eating spiders)

All Rössing Ammoxenidae were collected from pitfall traps

- *Ammoxenus coccineus* is a common and widespread species (T. Bird, pers. comm.)

The genus *Rastellus* was first described based in part on Rössing material, by Platnick & Griffin (1990).

- *R. narubis* is known from a restricted area of central western Namibia only, and was recorded from Lower Dome Site.
- *R. struthio* is more widespread, and was recorded from both Upper and Lower Ostrich Sites (the species name, *struthio*, is Latin for Ostrich, and refers to Ostrich Gorge).

4.4.2.3 Araneidae (orb-web spiders)

There are at least 25 species from this family found in Namibia but the Rössing material is unidentified beyond family. Very few came from pitfall traps. Most were caught in webs in vegetation throughout the area.

4.4.2.4 Caponiidae (spiders, no common name)

All Rössing material is from pitfall traps, and was identified as *Diploglena* species. The only species in the genus known from Namibia is *D. capensis*. It has been recorded from the central Namib (Gobabeb) before by Henschel *et al.* (2003), and all Rössing material is provisionally referred to it here.

4.4.2.5 Clubionidae (sac spiders)

Rössing material was identified to family only, but since only the genus *Clubiona* has been recorded from Namibia, it is assumed they belong to this. Two *Clubiona* species are known from Namibia. Besides pitfall trap material, specimens were handsampled in a variety of habitats.

4.4.2.6 Dictynidae (mesh-web spiders)

At least 3 genera, and an unknown number of species occur in Namibia, but the Rössing material was not identified beyond family. Besides some pitfall trap material, specimens were also caught in webs in vegetation.

4.4.2.7 Eresidae (velvet spiders)

Genus *Eresus*.

- One specimen from a reptile trap at the Lower Ostrich Site was identified as *Eresus* species. There is only one *Eresus* species recorded from Namibia, but it is not known if this is it or not.

Genus *Seothyra*. Rössing material was published on by Dippenaar-Schoeman (1990).

- *S. fasciata* was recorded from the Arandis Site, and is widespread in western southern Africa.
- *S. longipedata* is known from 2 localities only, of which the Lower Ostrich Site is one.
- *S. anettae* is known only from a single specimen collected from a pitfall at the Arandis Site.
- More, unidentified, *Seothyra* material was collected, mainly from trapdoor tunnels, at Arandis Site and the Lower Ostrich Site, but nowhere else in the area. Pitfall trap material from both these sites additionally includes juvenile material identified only as 'Eresidae', probably also *Seothyra*, but not possible to refer to species.
- The species *Seothyra griffinae*, listed as a Rössing endemic in Anon (no date, b), does not occur anywhere near Rössing, according to the authority cited there: Dippenaar-Schoeman (1990).

4.4.2.8 Filistatidae (crevice-weaver spiders)

Rössing material was not identified beyond family, but possibly more than one species is present. Filistatidae have been recorded from Namibia before, but there are no published species level records from the country, and it is therefore not possible to evaluate the Rössing specimens further. Besides

pitfall trap material, specimens were handsampled under stones and other shelter in the area.

4.4.2.9 Gnaphosidae (ground spiders)

One of the commoner spider families encountered at Rössing, but unfortunately none have been identified to species level.

- *Asemesthes* species. One of the commonest spiders at Rössing. At least 15 species have been recorded from Namibia, but their taxonomy is in disarray, and it is not known which are represented at Rössing. Eryn Griffin sorted pitfall trap material into 4 morphospecies.
- *Diaphractus* species. Only one species is known from Namibia, but it is not known whether the three Rössing specimens belong to it or not. All were from pitfall traps.
- *Megamyrmaekion* species. Only one species has been recorded from Namibia, but it is not known whether Rössing pitfall trap material represents it or not.
- *Micaria* species. One specimen was collected under stones at 'E camp pond'. There are 2 species recorded from Namibia, but it is not known which it them this is.
- *Setaphis* species. There are 9 species in Namibia, but it is not known which is represented by the Rössing specimens. Most were from pitfall traps, a few from under stones.
- *Zelotes* species. There are 12 species in Namibia, but it is not known which are represented by Rössing specimens. Most were from pitfall traps, some from under stones.
- A few pitfall trap specimens were identified to subfamily only: Drassodinae, Echeminae and Hemichloeinae, and many juveniles were not identified further than Gnaphosidae only.

4.4.2.10 Hahniidae (spiders, no common name)

A single specimen was found in a pitfall trap at the Upper Panner Site. The family is badly known in Namibia: at least two species may be present in the country, but it is not known which occurs at Rössing.

4.4.2.11 Hersiliidae (long-spinneret spiders)

- *Hersilia arborea*. A single pitfall trap specimen from the Lower Ostrich Site. This is a widespread species (Foord 2005).
- *Tyrotama fragilis*. Pitfall traps and under stones (Foord 2005).

4.4.2.12 Idiopidae (spurred trapdoor spiders)

Idiops species There are 6 species in Namibia, but it is not known which are these. Only a few specimens were recorded, all from pitfall traps, all at the Lower Dome Site.

4.4.2.13 Linyphiidae (sheet-web spiders)

The family includes about 15 Namibian species, but it is not known which are represented by the two Rössing specimens, from the Panner and Lower Ostrich Sites respectively.

4.4.2.14 Lycosidae (wolf spiders)

A large family with 93 species in Namibia, but the Rössing specimens were not identified beyond family. Only one was found in a pitfall trap, but many were hand-collected around water points.

4.4.2.15 Migidae (tingle trapdoor spiders)

A single specimen of *Moggridgea eremicola* came from a pitfall trap at the Lower Dome Site. It remains the only known record for this species in the world (Griswold 1987).

4.4.2.16 Oecobiidae (flatmesh-weaver spiders, star-legged spiders)

Rössing material has been identified as *Paroecobius* species. Only one *Paroecobius* species is known from Namibia, but pitfall trap material has been sorted into two unnamed morphospecies in the museum collection. Specimens were also collected under rocks.

4.4.2.17 Oonopidae (dwarf six-eyed spiders)

Rössing material has not been identified beyond family. All were from pitfall traps. There are at least 5 species of Oonopidae known from Namibia, but it is not known which are represented by the Rössing material.

4.4.2.18 Oxyopidae (lynx spiders)

Rössing pitfall trap material was not identified below family, though one sample in the collection is labelled *Oxyopes* species. There are two *Oxyopes* species known from Namibia.

There are also some hand-collected *Peucetia* specimens in the collection, mostly vegetation associated, identified as *Peucetia crucifer* (Lower Dome Site) and *P. viridis* (Panner Site) respectively. The former was published on by Van Niekerk & Dippenaar-Schoeman (1994).

4.4.2.19 Palpimanidae (palp-footed spiders)

- With one exception, pitfall trap material was identified as *Diaphorocellus* species, as were incidental hand-collected material, mostly from under stones. There are 3 *Diaphorocellus* species known from Namibia. One hand-sampled specimen in the museum collection has been identified as *D. biplagiata*. While there are literature records of *D. biplagiata* from Namibia (e.g. Henschel *et al.* 2003), the World Spider Catalogue lists it as occurring in South Africa only, implying that the Namibian specimens might be misidentified. For this reason, Rössing specimens are here listed as *Diaphorocellus* species only.

- *Palpimanus* species. A single specimen from the Stockpile Site. There are at least 5 *Palpimanus* species known from Namibia, but it is not known which this one is.

4.4.2.20 Philodromidae (running crab spiders)

- Most pitfall trap material is identified as *Hurriusa* species. Two *Hurriusa* species are known from Namibia, but in the museum collection the Rössing material is sorted into three morphospecies. No clear distributional difference between the 3 morphospecies is apparent – all 3 seem to occur everywhere in the Rössing area.
- *Philodromus* species. Hand-collected material associated with vegetation. There are four species known from Namibia.
- *Suemus* species. One specimen from the Panner Site. The World Spider Catalogue lists the genus as occurring only in South Africa, and no Namibian records could be found. Either this is a new record, or it is misidentified.
- *Thanatus* species. From pitfall traps, but also hand-collected associated with vegetation. Four species are known from Namibia.

4.4.2.21 Pholcidae (daddy long-legs spiders)

- *Pholcus* species. Only found in pitfall traps at the Stockpile Site. Two species are known from Namibia.
- *Smeringopus hypocrita*. Found in pitfall traps at all fixed trap sites.

4.4.2.22 Prodidomidae (spiders, no common name)

Most Rössing material is from pitfall traps, but a few were hand-collected under stones. The bulk have not been identified beyond family.

- A small number of specimens have been specified as either *Prodidomus* species or *Theuma* species in the museum collection. There are 3 *Prodidomus* and 16 *Theuma* species known from Namibia.
- *Namundra griffinae*. Only known from the Lower Dome and Stockpile Sites, and only described earlier this year (Platnick & Bird, 2007).

4.4.2.23 Salticidae (jumping spiders)

Among the most common spiders in the pitfall traps, and also hand-collected extensively throughout the area. There are at least 62 species in Namibia. Most were not identified beyond family, but some have been specified in the museum collection as: *Bianor* species, *Langona* species, *Mogrus* species and *Neaetha* species.

4.4.2.24 Scytodidae (spitting spiders)

All Rössing material has been identified as *Scytodes* species, but in the museum collection they have been sorted into two morphospecies. They were not found on the plains sites. There are 8 *Scytodes* species in Namibia.

4.4.2.25 Segestriidae (tube-web spiders)

Most Rössing material came from pitfall traps, though one was handsampled in a tube web. Material in the museum collection has been sorted into two morphospecies, but both seem to occur over the entire area. The family in Namibia includes only one genus, *Ariadna*, with 7 species. Rössing material is assumed to belong to *Ariadna* as well.

4.4.2.26 Selenopidae (wall spiders, flatties)

- One *Anyphops* species was collected in a pitfall trap at the Lower Ostrich Site. There are 3 species known from Namibia.
- One *Selenops* species was collected in the guest house at Arandis. There are 5 species known from Namibia.

4.4.2.27 Sicariidae (violin spiders)

- *Loxosceles pilosa*. Mostly from pitfall traps, one hand-sampled under a stone.
- *Sicarius* species, probably *allospinosis* (Lotz, pers. comm.). Besides pitfall traps, also hand-sampled under stones throughout area.

4.4.2.28 Sparassidae (huntspiders)

The family Sparassidae has a high rate of endemism in the Namib Desert. It includes such iconic species as the Dancing White Lady Spider, and the Wheel Spider. The Rössing material holds high potential interest, and may include species of concern, but the material is inadequately identified, and many of the identities listed below are suspect. The group is receiving attention from a German expert, Dr. Dirk Kunz, and it will hopefully be possible to treat it in more detail in future.

- *Arandisa* species. One specimen from the Lower Dome Site was identified as a potential *Arandisa* species. Since the specimen is a juvenile, this identification may not be accurate. The only Namibian species in the genus is *Arandisa deserticola*, a Namibian endemic, that could potentially occur at Rössing.
- *Carparachne* species. A series of specimens from the Arandis Site were identified as *Carparachne* species. Both Namibian species are dune specialists, so it is highly unlikely that the Rössing material indeed belongs to this genus.
- *Leucorchestris* species. The genus includes 7 Namibian species, of which 5 are endemic, and most are range restricted. The very few Rössing specimens have not been further identified, but hold high interest.
- *Microrchestris melanogaster*. Only one Rössing specimen has been identified to species level in the collection, but it is assumed the other *Microchestris* specimens are the same. It is a Namibian endemic, but the identification might not be accurate.
- *Olios* species. There are 4 species known from Namibia.

- *Orchestrella* species. There are 3 species known from Namibia. The Rössing material is sorted into two morphospecies in the museum collection.
- *Palystella* species. There are 3 species known from Namibia. The Rössing material is sorted into two morphospecies in the museum collection.

4.4.2.29 Tetragnathidae (long-jawed spiders)

Tetragnatha species. The genus has 6 known Namibian species. It was not found in pitfall traps, but all material was hand-collected, mainly on reeds around waterpoints.

4.4.2.30 Theridiidae (comb-footed spiders)

The Rössing material has not been identified beyond family. There are 13 species known from Namibia. Besides pitfall traps, mostly found under stones.

4.4.2.31 Thomisidae (crab spiders)

Only one specimen came from a pitfall trap, the rest were hand-collected from vegetation.

- *Diaea* species. Pitfall trap. Three species known from Namibia.
- *Heriaeus* species. Only one species known from Namibia, but it is unknown whether the Rössing material belongs to it.
- *Misumenops* species. Only one species known from Namibia, but it is unknown whether the Rössing material belongs to it.
- *Thomisus machadoi* and *T. schultzei*. Both widespread species.

4.4.2.32 Trochanteriidae (spiders, no common name)

Six specimens, of which 4 are from the Lower Dome Site, were identified as possibly *Platyoides* species. There are 3 species known from Namibia, but it is not known what these are.

4.4.2.33 Uloboridae (hackled orb spiders)

One specimen was hand-sampled in the Ostrich Gorge area. There are at least 2 species known from Namibia, but it is not known which one this is.

4.4.2.34 Zodariidae (ant spiders)

- The genus *Ceasetius* includes 7 species from southern Africa. In the revision by Jocque (1990a) a single Namibian specimen, handsampled at the Panner Site, was listed as belonging to an undescribed species, but description was postponed till more material is available.
- *Capheris* species. The genus has 9 Namibian species. Found in pitfall traps.
- *Cydrela* species. One specimen hand-sampled under stones at the Upper Ostrich Site. Three species known from Namibia.

- *Cyrioctea namibiensis*. This species was described from Arandis site by Platnick & Griffin (1988), and is known only from there.
- *Diores namibia*. This species was described from Rössing material by Jocqué (1990b). Most were from pitfall traps, and it was especially numerous at the Panner Site.
- *Heradida griffinae*. Described and still only known from the Rössing material studied by Jocqué (1987). Found in pitfall traps at the Lower Dome, Upper and Lower Ostrich Sites.
- *Mallinus* species. Handsampled under stones only. The genus has been recorded from Namibia before, but specimens have not been assigned to any particular species yet.
- *Palfuria panner*. Described from Rössing material (the name refers to Panner Gorge). It was only found once in a pitfall trap, and is a Namibian endemic, but is widespread outside the Rössing area (Szütz & Jocqué 2001).
- *Psammoduon deserticola*. Sandloving species, not found during Rössing survey. However, Jocque (1990a) lists a specimen from 'Khan', suggesting that it may occur in windblown sand in the area.
- There are also some specimens in the museum collection labelled as *Zodariidae* gen. nov. Their status is indeterminate.

4.4.3 Opiliones (harvestmen)

Harvestmen are typically forest dwellers in moister climates, and the endemic Namibian species are anomalies. The Rössing specimens of *Namutonia scabra* were published on by Starega (1992).

4.4.4 Pseudoscorpiones (false scorpions)

Ectactolpium and *Pseudohorus* species. The Rössing material was identified to genus only. Eight *Ectactolpium* and 6 *Pseudohorus* species are known from Namibia, and more than one of each may potentially occur at Rössing. One specimen from the Arandis Site is identified in the museum collection as *P. vermiformis*, but no further information is currently available about this species.

4.4.5 Scorpionida (scorpions)

Additional distributional information for scorpions was derived from Lamoral (1979).

4.4.5.1 Bothriuridae

Lisposoma elegans. Found throughout the area. A Namibian endemic, but widespread beyond Rössing. Rössing material was listed by Prendini (2005).

4.4.5.2 Buthidae

- *Parabuthus brevimanus*. Recorded mainly from the Stockpile and Panner Sites.

- *Parabuthus gracilis*. Found at the Arandis, Upper Ostrich, Lower Ostrich and Panner Sites. Lamoral (1979) did not record the species further south than Cape Cross.
- *Parabuthus granulatus*. Not recorded during the survey, but a widespread species that is expected to occur in the Rössing area as well.
- *Parabuthus namibensis*. A Central Namib endemic that was found at the Arandis, Upper Ostrich, Lower Ostrich and Panner Sites. Rössing material has been published on by Prendini (2003, 2004).
- *Parabuthus villosus*. One specimen each found at the Arandis, Upper Ostrich and Panner Sites.
- *Uroplectes pilosus*. Found at most of the fixed sites. The only other known locality for the species prior to the Rössing survey was Cape Cross (Lamoral 1979).
- *Uroplectes planimanus*. One specimen from Stockpile Site. Widespread elsewhere.
- *Uroplectes* species. Two specimens from the Panner and Lower Dome Sites respectively are labelled in the museum collection as an undescribed species. In addition, the occurrence of e.g. *U. otjimbinguensis* and *U. gracilior* at Rössing is also plausible (the former is known from Swakopmund, Hentiesbaai and the interior, the latter is known i.a. from Trekkopje), even though they have not been recorded yet.

4.4.5.3 Ischnuridae

Hadogenes tityrus. One specimen from a pitfall trap at the Stockpile Site. Near-endemic to Namibia, but widespread elsewhere in the country.

4.4.5.4 Scorpionidae

- *Opisthophthalmus carinatus*. One specimen from a pitfall trap at the Stockpile Site, another collected at the Mine Office Complex. A widespread species.
- *Opisthophthalmus coetzeei*. Found in pitfall traps at Arandis and Lower Dome Sites.
- *Opisthophthalmus wahlbergi*. One specimen in a pitfall trap at the Arandis Site.

4.4.6 Solifugae (solifuges, sun spiders)

4.4.6.1 Daesiidae

- *Biton* species. The genus has 16 known species in Namibia. Griffin (1990) considered the species in the Rössing material to be undescribed. It has not been described since. It was found in pittraps at mainly the Arandis and Upper Ostrich Sites.
- *Blossia falcifera*. Found at most fixed sites, but commonest at Lower Dome and Stockpile Sites. Widespread in southern Africa.

- *Blossia planicursor*. Found in pitfall traps, mainly at Arandis and Upper Ostrich Sites. Central Namib endemic.
- *Blossia* new species A of Griffin (1990). Found in pittraps at the Stockpile and Lower Dome Sites only.
- *Blossia* new species B of Griffin (1990). A total of only 3 specimens found in pitfall traps at the Panner and Lower Ostrich Sites only.
- *Blossia rooica*. Three single specimens from pitfall traps at the Stockpile, Upper Ostrich and Lower Ostrich Sites respectively. This species was not included in the summary by Griffin (1990), but the specimens in the museum collection carry this identification, and they were listed as such in the original identification sheets. Its occurrence at Rössing is not impossible.
- *Hemiblossia etosha*. Found at all fixed pitfall trap sites.
- *Namibesia pallida*. Found at several of the fixed pitfall trap sites, but only in numbers at the Stockpile Site.

4.4.6.2 Gylippidae

Trichotoma michaelsoni. Numerous in pitfall traps at the Arandis Site. Occasionally found at most of the other fixed trap sites, but absent from the rocky hillsides (Lower Dome and Stockpile Sites).

4.4.6.3 Hexisopodidae

Hexisopus moiseli. Two *Hexisopus* specimens were found in pitfall traps, at the Lower Ostrich and Panner Sites respectively, but both were juveniles and could not be identified to species. On distributional grounds, the species most likely to occur in the area is *H. moiseli*, since it has been recorded from i.a. '32 km E of Swakopmund', which was here assumed to be along the Swakopmund-Usakos road.

4.4.6.4 Melanoblossidae

- *Daesiella pluridens*. This species was not recorded during the survey. It is known only from 'Arandis' (Wharton 1981).
- *Lawrencega longitarsis*. Only found at the Upper Ostrich and Arandis Sites.
- *Lawrencega minuta*. Found at the Upper Ostrich, Arandis and Lower Ostrich Sites.
- *Lawrencega solaris*. Only found at the Upper Ostrich and Arandis Sites.
- *Lawrencega* new species. Found in numbers at the two rocky hillside fixed sites (Stockpile and Lower Dome Sites), but only occasionally at a few other sites. Listed as new in Griffin (1990), but not yet described. Known only from the Rössing area.

4.4.6.5 Solpugidae

- *Solpugassa furcifera*. A single specimen was found in a pitfall trap at the Lower Ostrich Site. It was not identified beyond genus. There are

two *Solpugassa* species in Namibia, and on distributional grounds the likely one to occur at Rössing is *S. furcifera*. This species was not included in the summary by Griffin (1990).

- *Solpugema* species. Found mostly in pitfall traps at the Arandis Site, but also hand-sampled at the Lower Ostrich Site. There are 5 species known from Namibia. Based on Wharton (1981), *S. genucornis* is the one most likely to occur at Rössing. This species was not included in the summary by Griffin (1990).
- *Solpugiba lineata*. Very common at the plains and riverbed fixed sites, but completely absent from the rocky hillside sites.
- *Solpugista bicolor*. Common at the plains fixed sites, occasionally found at the riverbed sites, absent from the rocky hillside sites.
- *Zeria lawrencei*. Found at several of the fixed pitfall trap sites, but absent from the rocky hillside sites.

4.5. Insecta (six-legged invertebrates, insects)

4.5.1 Blattodea (cockroaches)

Besides at least one species of alate cockroach (Blattodea species 1), eight morphospecies of apterous cockroaches were recorded in the pitfall trap survey. They were numbered as species 2, 5, 6, 7, 8, 9, 10 and 11 respectively. They were not identified further at the time. Blattodea species 2 was the most commonly encountered species and occurred at all pitfall trap sites as well as in handsampling blocks 3, 4 and 9. At the other end of the spectrum Blattodea species 11 was represented by a single specimen only. Most Blattodea occurred at the riverbed sites and the least on rocky hillsides.

4.5.2 Coleoptera (beetles)

4.5.2.1 Anthicidae (ant beetles)

Anthicidae were found in the pitfall traps but, being alate, they were not treated further.

4.5.2.2 Bruchidae (seed weevils)

Bruchidae may have been found in the pitfall traps, but being alate, they would not have been specifically noted. One species is known from the area: *Bruchidius cretaceus*. Recorded from Arandis (Anton & Delobel 2003).

4.5.2.3 Buprestidae (jewel beetles)

Being alate, Buprestidae were not specifically noted in the pitfall trap survey, but some material from the traps had been worked on since.

- *Acmaeodera decemguttata*. Recorded from the Stockpile Site (Holm 1986a). Widespread in southern Africa.

- *Acmaeodera liessnerae*. First described from material collected during the Rössing project (Holm 1986a), but also found elsewhere. Named after project participant Hella Liessner. Namibian endemic.
- *Acmaeodera penrithae*. First described in part from material collected during the Rössing project (Holm 1985). Namibian endemic.
- *Acmaeodera swammerdami*. Recorded from the Upper Ostrich Site by Holm (1986a). Widespread elsewhere.
- A few other *Acmaeodera* species have been recorded from localities surrounding the Rössing area and may potentially occur there as well.
- *Julodis eggho*. Not recorded during the survey but probably does occur in the Rössing area, since it is widespread in the Namib Desert and is known i.a. from Palmenhorst near the Khan-Swakop confluence (Gussmann 2000).
- *Julodis namibiensis*. Rössing material was published on by Gussmann (1995).
- *Nothomorphoides irishi*. Described from pitfall trap material from the Arandis, Upper Ostrich and Lower Ostrich Sites (Holm 1986b), and still known only from there.

4.5.2.4 Carabidae (ground beetles)

- *Anthia* species. Common at the riverbed sites, also found on plains sites, absent from rocky hillsides. There are at least 4 species known from Namibia.
- *Graphipterus* species. At least 53 species are known from Namibia, many endemic and range-restricted. The Rössing material therefore holds high interest, but has not been identified further. A few specimens from pitfall traps at the Arandis, Upper Ostrich and Lower Ostrich Sites.
- *Microlestia* species. Only found at the Upper Panner Site, but relatively common there. At least 3 species are known from Namibia.
- Besides two alate morphospecies (Carabidae species 1 and 5), four presumably apterous morphospecies (Carabidae species 2, 3, 4 and 6 respectively) were found in the pitfall traps. Sp 2 was only found at the Panner Site, species 3 and 4 only at the Arandis Site, and species 5 and 6 only at the Stockpile Site.

The following two species are alate, but were treated throughout the survey as if they were apterous. The reason for this is no longer apparent.

- *Calosoma* species. At least 4 species are known from Namibia. Only once recorded, at the Stockpile Site.
- *Passalidius fortipes*. Found at the Arandis, Panner and Lower Ostrich Sites. Widespread elsewhere.

4.5.2.5 Chrysomelidae (leaf beetles)

Found in pitfall traps, but being alate, specific records were not kept.

4.5.2.6 Coccinellidae (ladybird beetles)

At least one species was found, but being alate, it was not treated further.

4.5.2.7 Curculionidae (snout beetles, weevils)

- *Brachycerus rotundatus*. Found in pitfall traps at the Arandis Site.
- *Brachycerus* cf. *granifer*. Found in pitfall traps at the plains sites, also handcollected at the plains blocks 2, 3 and 5.
- *Brachycerus* cf. *perfossus*. Once found in a pitfall trap at the Upper Ostrich Site.
- *Episus contractus*. A widespread species. At Rössing it was only found at plains pitfall sites, and also at plains handsampling blocks 2, 3 and 6. Louw (1986) had previously recorded the species from the area based on collections predating the Rössing survey.
- *Gronops brincki*. Not found in pitfall traps, but hand-collected in the area.
- *Hyomora manca*. Found in riverbed and plains pitfall traps. Louw (1981) had listed pre-survey material from the area.
- *Hypocolobus* species. In pitfall traps found only at the Panner Site, but also handsampled in blocks 1 and 5.
- *Hyomora porcella*. Found in pitfall traps, mainly at the plains sites.
- *Leptostethus spicatiostris*. Not recorded during the survey. Known from several collections near Rössing Mts, and one at Ganab, so probably occurs in the area (Thompson 1988).
- *Ocladius* species. Found mostly in plains pitfall traps, but also handsampled at plains blocks 4, 6 and 13. There are seven species known from Namibia.
- *Spartecerus* cf. *mendax*. Mostly found in plains or watercourse pitfall traps, but also handsampled in blocks 4 and 8.
- *Spartecerus nasalis*. Mostly found in rocky hillside pitfall traps, but also handsampled in block 8.
- Brachyderinae species. Mostly from pitfall traps at the Arandis Site, with one record each from the Stockpile Site and handsampling block 1

All the previous Curculionidae are apterous. The following are alate:

- *Macrolarinus angustulus*. An alate species, but for some reason it was included in pitfall trap records till the end. Found at almost all sites.
- Ceutorhynchinae species. Another alate, but included in data sheets. Also found at almost all fixed sites.
- *Lixus* species. Found once at the Panner Site.
- *Siderodactylus* species. Found at the Arandis Site only.
- Barinae species. Mostly found at the Panner Site.
- Zygotinae species. Only found at rocky hillside sites.

4.5.2.8 Dermestidae (museum beetles)

Commonly found in the pitfall traps, but alate and not treated further. Anon (no date, b) mentions an undescribed *Attagenus* species from Rössing under study by Dr. Kalik. No reference to such a species could be traced; the Museum library has no publications by Kalik.

4.5.2.9 Dytiscidae (water beetles)

Yolina brincki. A Namibian endemic. Mentioned in the limnological survey notes.

4.5.2.10 Glaresidae (tiny beetles, no common name)

Glaresis koenigsbaueri. Not found during survey, but probably occurs in area, as it is known both from the Rössing Mts and further inland (Scholtz 1983). A Namibian endemic.

4.5.2.11 Histeridae (hister beetles)

Found in pitfall traps, but alate, hence not treated further.

4.5.2.12 Hydraenidae (moss beetles)

Ochthebius species. Mentioned in the limnological survey notes. Six species are known from Namibia, two of them being endemic.

4.5.2.13 Hydrophilidae (water scavenger beetles)

Mentioned in limnological survey notes.

4.5.2.14 Meloidae (blister beetles)

Several different species were found in pitfall traps, but since they are alate they were not treated further. One species has been described from the material:

Iselma deserticola. Known only from the Arandis, Upper Ostrich and Lower Dome Sites (Bologna *et al.* 2001).

4.5.2.15 Melyridae (flower beetles)

Specimens found in pitfall traps were not treated further at the time since they are alate, however, some have been independently identified:

- *Hedybius irishi*. Only known from 3 specimens found in pitfall traps at the Lower Ostrich Site only (Wittmer 1988).
- *Metaphilhedonus swakopmundensis*. Only known from pitfall traps at the Lower Dome, Stockpile and Lower Ostrich Sites (Wittmer 1989).

4.5.2.16 Monommidae (beetles, no common name)

Two morphospecies were found in pitfall traps, mostly those at rocky hillside sites. The family includes nine species in Namibia.

4.5.2.17 Ptinidae (spider beetles)

- Pitfall trap material was sorted into 5 morphospecies, but they were never identified further. In total, very few specimens were found, and most were from rocky hillside sites.
- *Damarus singularis*. A predominantly coastal species that has been recorded as far inland as Rössing Mtn (Irish 1996), but is unlikely to occur nearer to the mine. The origin of a purported undescribed *Damarus* species in the Rössing area, attributed to Irish in Anon (no date, b), is therefore unclear.

4.5.2.18 Scarabaeidae (dung beetles, fruit chafers)

Since they are alate, those found in pitfall traps were not treated further, however, some have been independently identified.

- *Anoplocheilus namibicus*. Survey material labelled 'Rössing Mine' (implying the Stockpile Site) was published on by Marais & Holm (1989).
- *Pycnoperus krikkeni*. Found in pittraps at the Arandis Site, Upper and Lower Ostrich Sites (Scholtz & Howden 1987).

4.5.2.19 Silvanidae (flat grain beetles)

Specimens were found in plains and watercourse pitfall traps, and also handsampled in block 9, but since they are alate they were not treated further. There are 8 species known from Namibia.

4.5.2.20 Tenebrionidae (toktokkies, darkling beetles)

- *Aphrotus tricorniger*. Found in small numbers in pitfall traps at the Upper Ostrich, Arandis and Panner Sites.
- *Caenocrypticus damara*. Endemic to Central Western Namibia, this species was not recorded during the Rössing survey. However, since it is known from i.a. Rössing Mountain and the Khan River SE of Trekkopje (Endrödy-Younga 1996), it probably occurs near Rössing Mine which is between the previous two, as well.
- *Cauricara velox*. Found only in plains pitfall traps, and also handsampled in plains blocks 1 and 9.
- *Ennychiatus fitzsimonsi*. Found in pitfall traps at plains sites only.
- *Epiphysa arenicola*. Found in pitfall traps at all plains and watercourse sites, also handsampled in blocks 3 and 10.
- *Eurychora* species. Found mainly in pitfall traps at plains sites, also handsampled in block 6.
- *Geophanus* species. Collected material was sorted into 3 morphospecies, species 1, 2 and 4 respectively. *Geophanus* species 1 was abundant at the Stockpile, Lower Dome and Lower Ostrich Sites. *Geophanus* species 2 was abundant at the Arandis and Upper Ostrich Sites. *Geophanus* species 4 was present in low numbers at all sites. Species 2 and 4 were also handsampled in block 4.
- *Gonopus* species. These were especially numerous in pitfall traps at the Panner Site. The genus had been revised after the Rössing Survey,

but for some reason no material from there was included in the (posthumously produced) publication (Endrödy-Younga 2000). More than one species may occur in the area.

- *Herpiscius* species. Found mostly in pitfall traps on rocky hillsides. There are 3 species known from Namibia.
- *Horatoma deserticola*. A single specimen was found in a pitfall trap at the Arandis Site. The original description of the species was based in part on this specimen (Penrith & Endrödy-Younga 1994).
- *Horatoma spinipes*. Found in pitfall traps at rocky hillside sites only. Rössing material was described by Penrith & Endrödy-Younga (1994).
- *Metriopus depressus*. Found in pitfall traps at the plains and rocky hillside sites, but absent from the riverbed sites. Also handsampled in blocks 2, 3, 4, 5 and 13.
- *Pachynoteles machadoi*. Only three specimens found in pitfall traps at the the Stockpile and Lower Ostrich sites. Material published on by Penrith & Endrödy-Younga (1994).
- *Pachynoteles punctipennis*. Found in pitfall traps at most of the fixed sites, particularly common at Lower Ostrich. The species was described mainly from Rössing material by Penrith & Endrödy-Younga (1994).
- *Palpomodes physoptera*. Found in pitfall traps at the plains sites of Arandis and Upper Ostrich only.
- *Parastizopus armaticeps*. Common in pitfall traps at plains and watercourse sites, also handcollected in block 4.
- *Phanerotomea damarensis*. Common in plains and watercourse pitfall traps, also handcollected at block 1.
- *Physadesmia globosa*. Common in plains and watercourse pitfall traps, also handcollected at blocks 5, 6, 10 and 13.
- *Physosterna cribripes*. Common in plains and watercourse pitfall traps, also handcollected in block 4.
- *Planostibes* species. Found in pitfall traps at most fixed sites. There are 2 species known from Namibia.
- *Rhammatodes aequalipennis*. Very common in pitfall traps throughout the area, also handsampled in blocks 1, 3, 4, 5, 6, 8, 9 and 10.
- *Rhammatodes longicornis*. Common in pitfall traps, mainly at rocky hillside sites.
- *Rhammatodes tagenesthoides*. Found in pitfall traps at rocky hillside and watercourse sites, but much less common than either of the preceding two other *Rhammatodes* species.
- *Somaticus bohemani*. Found in pitfall traps mainly at the rocky hillside sites.
- *Somaticus stali*. Only two specimens from pitfall traps at the Arandis Site. Published information (Koch 1955) suggests that the species may be a range-restricted Central Namib endemic.
- *Stenocara aenescens*. A widespread species, that had previously been recorded i.a. from Rössing Mts and from Khan River SE of Trekkopje, so it can be expected to also occur at Rössing Mine which is between these two, but not recorded during the survey.

- *Stenocara dilaticornis*. Exceedingly common in pitfall traps at all fixed sites, also handsampled at block 1.
- *Stenocara gracilipes*. Common in pitfall traps at rocky hillside and watercourse sites.
- *Stips dohrni*. Found in pitfall traps at plains and riverbed sites, also handsampled in block 10.
- *Synhimba melancholica*. Found only in pittraps at the Lower Dome Site, but quite common there (obviously not any more). Also occurs outside the area.
- *Trachynotidus rufozonatus*. Found in pitfall traps throughout the area.
- *Zophosis (Calosis) amabilis*. A plains species found in pitfall traps at plains sites, also handcollected at blocks 1 and 9.
- *Zophosis (Carpicella) latisterna*. A plains species found in pitfall traps mostly at the Upper Ostrich Site.
- *Zophosis (Gyrosis) ornatipennis*. Found in pitfall traps mainly at watercourse and plains sites, also handcollected at blocks 4, 5 and 9.
- *Zophosis (Occidentophosis) damarina*. Found mainly in plains pitfall trap sites, also handcollected at blocks 1, 3, 5 and 6.
- *Zophosis (Protocalosis) balti*. A Central Western Namibian endemic that was not recorded during the survey, but had previously been recorded from Rössing Mountain, Arandis, and Trekkopje (the original farm 120, not the current mine), so it does occur in area (Penrith 1977).
- *Zophosis (Scopulophosis) fulgens*. A Central Western Namibian endemic, ranging from inland areas as far west as Rössing Mountain (Penrith 1977), so should occur near Rössing Mine, even though it was not recorded by the survey.
- *Zophosis (Z.) dorsata*. Found in pitfall traps at plains sites only.
- *Zophosis (Z.) kochi*. Found in pitfall traps, only at the Arandis Site, but quite common there. Also handsampled in the adjacent blocks 2, 3 and 5.
- *Zophosis (Z.) lamentabilis*. Only found in pitfall traps at the Arandis Site.
- *Zophosis (Z.) mniszewski*. A Central Western Namibian endemic known from many surrounding areas, i.a. recorded from Rössing Mountain (Penrith 1977). Was not recorded during the survey but probably occurs in the area.

A few Tenebrionidae could not be identified to species level at the time and were sorted into morphospecies.

- Tenebrionidae species 9. Found in pitfall traps throughout the area, quite common in places, also handsampled in block 10.
- Tenebrionidae species 10. Found at the Arandis, Upper and Lower Ostrich Sites.
- Tenebrionidae species 13. Found mainly at plains sites.
- Tenebrionidae species 16. Found at the Upper Ostrich Site only.
- Tenebrionidae species 17. Found at the Upper Ostrich and Panner Sites only.
- Tenebrionidae species 18. Found at plains sites only.
- Tenebrionidae species 27. A single specimen from handsampling in block 1.

The following alate Tenebrionidae were also recorded (the previous are all apterous).

- *Cheirodes* species.
- *Cyphostethe tau*. Found in plains and watercourse pitfall traps, also handsampled in block 9.
- *Neocaedius* species Extremely abundant in pitfall traps, but only at the Panner Site. Also handsampled at the nearby Piet-se-gat, and in the adjacent block 6.
- *Tribolium* species.
- Alleculinae. Pitfall material has been sorted into at least 2 morphospecies.
- Drosochrini. Found both in pitfall traps, and handsampled in blocks 2, 3 and 9.

4.5.2.21 Thorictidae (beetles, no common name)

A single specimen was found in a pitfall trap at the Stockpile Site. This is a badly known group. There is only one species known from Namibia, and that is known only from the original material collected at Gobabeb. It is not known whether the Rössing material belongs to it or not.

4.5.2.22 Coleoptera family indeterminate

Coleoptera species 1. This could not be assigned to any beetle family at the time. It was found in pitfall traps at the Stockpile and Panner Sites only.

4.5.3 Dermaptera (earwigs)

Earwigs prefer moister climates and are not very common in Namibia. Only 4 species have been recorded from the country. Therefore it is unexpected to find three morphospecies in the arid Rössing area.

- Dermaptera species 1. Found in pitfall traps at the Arandis and Panner Sites, and once found inside the guest house in Arandis.
- Dermaptera species 2. Common in pitfall traps at the Panner Site, only single specimens recored elsewhere.
- Dermaptera species 3. Found in small numbers in pitfall traps throughout most of the area.

4.5.4 Diptera (flies and allies)

Flies, being alate, were not specifically sampled for during the pitfall trap survey, but a large number got into the traps anyway. All this material was preserved, and some of it had found its way into print by now. What follows below does no credit to the diverse dipteran fauna of the Rössing area, though.

4.5.4.1 Asilidae (robber flies)

Notes mention Asilidae, without further details.

4.5.4.2 Bombyliidae (bee flies)

- *Apolysis thornei*. Recorded from the Upper Ostrich and Panner Sites (Greathead 2000).
- *Australoechus molitor*. Recorded from the Upper Ostrich and Stockpile Sites (Greathead 2000).
- *Australoechus naibensis*. Recorded from all sites except the Stockpile (Greathead 2000).
- *Crocidium immaculatum*. Recorded from the Panner Site only. Widespread elsewhere (Greathead 2000).
- *Crocidium phaenochilum*. Recorded from the Lower Dome Site only. Widespread elsewhere (Greathead 2000).
- *Heterotropus apertus*. Only known from 3 specimens collected during the Rössing survey. One is from the Upper Ostrich Site, the other two from the Stockpile Site (Greathead 2000).
- *Hyperusia soror*. Recorded from the Arandis and Upper Ostrich Sites. Namibian endemic, widespread elsewhere in the country (Greathead 2000).
- *Parisus aurantiacus*. Recorded from the Arandis Site (Greathead 2000).
- *Parisus damarensis*. Known only from the town of Okahandja, and 3 sites in the Rössing area (Greathead 2000).
- *Pteraulacodes hessei*. This species is known only from the imprecise locality 'Welwitschia Flats', which is in the Husab area across the Khan River from Rössing Mine (Lindner 1972). It could potentially occur in the mining area as well.

4.5.4.3 Calliphoridae (flesh flies)

- *Bengalia peuhi*. Found at the Panner Site (Kurahashi & Kirk-Spriggs 2006).
- *Chrysomya albiceps*. Found at the Arandis Site (Kurahashi & Kirk-Spriggs 2006).
- *Chrysomya chloropyga*. Found at the Upper Ostrich Site (Kurahashi & Kirk-Spriggs 2006).
- *Rhyncomya hessei*. Found at the Lower Ostrich Site (Kurahashi & Kirk-Spriggs 2006).
- *Rhyncomya messoria*. Found at the Upper Ostrich Site (Kurahashi & Kirk-Spriggs 2006).
- *Rhyncomya minutalis*. Found at the Arandis Site (Kurahashi & Kirk-Spriggs 2006).
- *Stomorphina guttata*. Found at the Panner Site (Kurahashi & Kirk-Spriggs 2006).
- *Zumba antennalis*. Found at the Panner and Lower Ostrich Sites (Kurahashi & Kirk-Spriggs 2006).

4.5.4.4 Ceratopogonidae (biting midges)

Aquatic larvae recorded by the limnological survey.

4.5.4.5 Chironomidae (midges)

Aquatic larvae recorded by the limnological survey.

4.5.4.6 Culicidae (mosquitoes)

Aquatic larvae recorded by the limnological survey. The following species identifications exist, but no further details are known.

- *Anopheles listeri*
- *Culex theileri*
- *Culiseta longiareolata*

4.5.4.7 Dolichopodidae (long-legged flies)

Aquatic larvae recorded by the limnological survey.

- *Hydrophorus praecox*. A widespread species, recorded (presumably as aquatic larvae) from 'Boulder Pool 3' and 'Panner HC7' by Grichanov (2000).

4.5.4.8 Ephydriidae (shore flies)

Ephydra stuckenbergi. Found around water. Adults were recorded by the limnological survey, but no further details are known.

4.5.4.9 Hippoboscidae (horse flies)

Large horseflies were occasionally encountered during fieldwork. No further information is available.

4.5.4.10 Sarcophagidae (carrion flies)

Very numerous in pitfall trap material. No further information available.

4.5.4.11 Tephritidae (fruit flies)

- *Brachydesis rivularis*. Recorded from the Lower Dome Site (Hancock *et al.* 2001).
- *Deroparia reticulata*. Namibian endemic, recorded from the Lower Dome Site. (Hancock *et al.* 2001).
- *Desmella myiopitoides*. Recorded from the Lower Dome Site (Hancock *et al.* 2001).
- *Euryphalara barnardi*. Namibian endemic, recorded from the Lower Dome Site (Hancock *et al.* 2001).
- *Euryphalara mecistocephala*. Namibian endemic, recorded from most fixed pitfall trap sites (Hancock *et al.* 2001).
- *Hyaloctoides semiater*. Recorded from the Panner, Lower Dome and Lower Ostrich Sites (Hancock *et al.* 2001).

- *Hyaloctoides superhyalinus*. Near-endemic to Namibia. Recorded from the Lower Dome and Lower Ostrich Sites, also known from Husab Mountain (Hancock *et al.* 2001).
- *Hyalotephritis australis*. Recorded from the Lower Dome Site (Hancock *et al.* 2001).
- *Insizwa oblita*. Namibian near-endemic, recorded from the Panner Site (Hancock *et al.* 2001).
- *Leucothrix barbata*. Recorded from the Upper Ostrich and Lower Dome Sites, also known from Husab Mountain (Hancock *et al.* 2001).
- *Leucothrix oryx*. Recorded from the Stockpile Site, also known from Husab Mountain (Hancock *et al.* 2001).
- *Metasphenisca interrupta*. Recorded from most fixed pitfall trap sites (Hancock *et al.* 2001).
- *Metasphenisca longulior*. Recorded from the Panner Site (Hancock *et al.* 2001).
- *Platomma luniferum*. Namibian near-endemic, known i.a. from Husab Mountain (Hancock *et al.* 2001), probably occurs at Rössing as well.
- *Xenodorella mira*. Namibian endemic, recorded from the Arandis Site (Hancock *et al.* 2001).

4.5.5 Ephemeroptera (mayflies)

Mayflies of the family Baetidae were recorded, probably as aquatic nymphs, b the limnological survey.

4.5.6 Hemiptera (bugs)

Since most bugs are alate, those that were found in pitfall traps were preserved, but no specific records were kept.

4.5.6.1 Aphididae (aphids, plant lice)

Aphids were recorded as an aside by the limnological survey.

4.5.6.2 Cicadellidae (leafhoppers)

Found in pitfall traps, but alate and not treated further.

4.5.6.3 Cicadidae (cicadas)

Occasionally found in pitfall traps, but alate and not treated further.

4.5.6.4 Fulgoroidea (planthoppers)

At least five morphospecies were recorded in the first month, before alate taxa were discarded. These initial records indicate the following site preferences.

- Fulgoroidea species 1. Only at the Lower Dome Site.
- Fulgoroidea species 2. Only at the Arandis Site.
- Fulgoroidea species 3. Only at the Panner Site.

- Fulgorioidea species 4. Only at the Lower Dome and Stockpile Sites (rocky hillsides).
- Fulgorioidea species 5. Only at the Arandis Site.

4.5.6.5 Lygaeidae (seed bugs, ground bugs)

Certainly occur, but alate and records not kept.

4.5.6.6 Naucoridae (saucer bugs)

Aquatic species recorded by the limnological survey.

4.5.6.7 Pentatomidae (stink bugs)

Certainly occur, but alate and records not kept.

4.5.6.8 Pleidae (pygmy backswimmers)

Aquatic species recorded by the limnological survey.

4.5.6.9 Psyllidae (jumping plant lice)

Three species of endemic psyllids have been recorded from *Tamarix* trees in the Lower Swakop River between the mouth and Goanikontes (Hollis 1974). They potentially occur in the Khan River adjacent to Rössing Mine as well. They were not recorded during the survey. They are *Colposcения australis*, *Colposcения namibiensis* and *Crastina swakopensis*. The former two are also known from the Lower Kuiseb River, but the latter is endemic to the Lower Swakop River according to current knowledge.

4.5.6.10 Reduviidae (assassin bugs)

Besides at least one alate species that was not treated further, five apterous morphospecies were found in pitfall traps. Some of these might be juveniles of alate species.

- Reduviidae species 2. Found mostly at the Panner Site, also handsampled in block 3.
- Reduviidae species 3. Found at most sites, also handsampled in block 2.
- Reduviidae species 4. Found ,mostly at the Upper Ostrich Site, also handsampled in block 2 (which includes the Upper Ostrich Site).
- Reduviidae species 5. One specimen found at the Panner Site only.
- Reduviidae species 6. One specimen found at the Upper Ostrich Site only.

4.5.6.11 Tingidae (lace bugs)

Found in pitfall traps, but alate and not treated further.

4.5.7 Hymenoptera (bees, wasps, ants)

Just as for flies, bees were commonly found in pitfall traps and all were preserved, but since most hymenopterans are alate, they were not considered further. What follows below does no credit to the diverse hymenopteran fauna in the Rössing area.

4.5.7.1 Andrenidae (bees, no common name)

Meliturgula haematospila. Recorded from the Lower Dome Site, also handsampled but block not recorded (Eardley 1991b).

4.5.7.2 Anthophoridae (carpenter bees)

- *Tetraloniella abrochia*. Described in part based on Rössing material, from the Stockpile Site (Earley 1989), but widespread, albeit rare, elsewhere.
- *Thyreus delumbatus*. Recorded from the Arandis and Upper Ostrich Sites, also handsampled but block not recorded (Eardley 1991a).

4.5.7.3 Apidae (honey bees)

The ubiquitous honey bee, *Apis mellifera*, also occurs in the Rössing area.

4.5.7.4 Bethyloidea (cuckoo wasps and allies)

Besides normally alate species, the group includes species where one or both sexes are apterous. Apterous specimens referable to Bethyloidea were found in pitfall traps. Only one species seemed to be involved, but it was not identified further. Most came from the Lower Ostrich Site.

4.5.7.5 Formicidae (ants)

Worker ants, being apterous, were recorded in the pitfall traps. Alate, reproductive ants were seldom found – those that were are presumed to belong to the same species as the workers. Unfortunately most ants were only recorded as morphospecies and not identified further.

- *Camponotus fulvopilosus*. This common ant was encountered at most fixed sites, but was more common in watercourses. Also handsampled in blocks 5 and 9.
- Formicidae species 1. Very common at rocky hillside and watercourse sites, but almost absent from plains sites (although handsampled in block 9).
- Formicidae species 2. One specimen from the Lower Ostrich Site only.
- Formicidae species 3. Very common at all fixed sites.
- Formicidae species 4. Very common at all fixed sites, also handsampled in block 6.
- Formicidae species 5. Found at all fixed sites, also handsampled in block 9.
- Formicidae species 6. Found in small numbers at most fixed sites.

- Formicidae species 7. Found at rocky hillside and watercourse sites only.
- Formicidae species 8. Very common at all fixed sites, also handsampled in block 4.
- Formicidae species 9. Very few specimens found, almost all of them at the Arandis Site.

4.5.7.6 Mutillidae (velvet ants)

Male velvet ants are apterous and were recorded, while the alate females were preserved but not treated further.

- Mutillidae species 1. Found at all fixed sites, also handsampled in block 1.
- Mutillidae species 2. Found at most fixed sites.
- Mutillidae species 3. Found at the Arandis, Lower and Upper Ostrich Sites only.
- Mutillidae species 4. Found in small numbers at most fixed sites, commoner at the Stockpile and Upper Ostrich Sites.
- Mutillidae species 5. Mostly found at plains and watercourse sites, also handsampled in block 3.
- Mutillidae species 6. Only two specimens found, one at each of the Upper and Lower Ostrich Sites.
- Mutillidae species 7. Small numbers were found at various fixed sites, with no obvious distribution pattern emerging.
- Mutillidae species 8. Found in larger numbers at the Stockpile and Panner Sites, but almost absent everywhere else.

4.5.7.7 Parasitica (parasitic wasps)

A large variety of tiny parasitic wasps were found in pitfall traps. Being alate, they were preserved but not treated further.

4.5.7.8 Pompilidae (spider-hunting wasps)

Being alate, these were preserved but not treated further. Given the high diversity of spiders in the area, a corresponding diversity of specialist spider predators is expected.

4.5.7.9 Sphecidae (sand wasps)

Specimens were found in pitfall traps, but being alate, were not treated further. The following three species are known in the literature (Lomholdt 1985) from '40 km NE Swakopmund' and may be expected to occur in the mining area as well.

- *Miscophus kriechebaumeri*. Widespread elsewhere.
- *Miscophus sabulosus*. Central Namib endemic.
- *Namiscophus pilosus*. Central Namib endemic.

4.5.8 Isoptera (termites)

Worker termites are apterous, and were recorded in the pitfall traps. Alate reproductive termites were encountered only twice, in response to rainfall events.

- Hodotermitidae, *Hodotermes mossambicus*. The ubiquitous harvester termite was abundant at all fixed trap sites, also handsampled in blocks 9 and 13. It had previously been reported from three places in the Rössing area, all along the Usakos-Swakopmund main road (Coaton & Sheasby 1975).
- Kalotermitidae, *Epicalotermes* species. Found in small numbers at most fixed sites. Coaton & Sheasby (1972) had already recorded the genus (no species specified) along the main road through the area.
- Termitidae, Nasutitermitinae species. Small numbers were found at the Lower Ostrich Site, and a few at the Arandis Site. They have not been identified further, but the only genus that is expected to occur in the Rössing area is *Trinervitermes*, of which 4 species are known from Namibia (Coaton & Sheasby 1972).
- Rhinotermitidae, *Psammotermes allocerus*. Not recorded during the survey, probably because their habits are not conducive to sampling by pitfall trap methods. They have been recorded from several places along the main road through the area by Coaton & Sheasby (1973).

4.5.9 Lepidoptera (butterflies and moths)

Numerous butterflies and moths were found in the pitfall traps, but the loss of scales and setae following immersion in liquid generally renders them unidentifiable to the point where it was believed it would serve no purpose to even preserve them. They were commonly seen during the survey, but not collected. The handcollecting methods employed were aimed at recording the widest variety of insects in the limited time available, and the specialised and time-consuming treatment needed by Lepidoptera was not compatible with this. The rotary trap, which was meant to fill the gap and capture flying insects like these, did not function. As a result, no Lepidoptera were recorded, and the true diversity and abundance of the group remains essentially unknown for the area.

4.5.10 Mantodea (mantids)

Two apterous mantid specimens each were collected at the Stockpile and Upper Ostrich Sites respectively. They were not identified further.

4.5.11 Neuroptera (lacewings and antlions)

Lacewings were found in preservative traps, but are alate and were not treated further.

4.5.12 Odonata (dragonflies and damselflies)

Rössing material was collected mainly by the limnological survey as aquatic nymphs, but adults were also handsampled by the entomological survey, e.g. at the Arandis Sewerage works. Since Odonata are alate the material was not treated further at the time, but it is known to have since been identified and incorporated into Suhling & Martens (2007). The latter, however, does not list localities, and while dots in the Rössing area are apparent on the distribution maps for some species, the tiny size of the maps does not allow any details to be deduced. The following list is therefore certainly incomplete.

- Aeshnidae, *Anax* species. Limnological survey.
- Coenagrionidae species. Limnological survey.
- Gomphidae, *Paragomphus* species. Limnological survey
- Libellulidae, unspecified species. Limnological survey.
- *Palpopleura jucunda*. Martens *et al.* (2003) recorded this widespread species from near the main road in the Rössing area east of Arandis.

4.5.13 Orthoptera (grasshoppers, locusts and crickets)

4.5.13.1 Acrididae (short-horned grasshoppers)

A variety of grasshoppers occur, but being alate, only the following one apterous species was recorded.

- Lithidiinae species. Tiny apterous grasshoppers that were found in pitfall traps at plains and watercourse sites, but not on rocky hillsides. Also handsampled in block 4. Some 7 species in 2 genera are known from Namibia, and many are endemic, but these were not identified further.

4.5.13.2 Bradyporidae (koringkrieks, armoured ground crickets)

- *Acanthoplus longipes*. Namibian near-endemic, only found on rocky hillside fixed trap sites at Rössing (Irish 1992). Also handsampled in block 4, which is consistent with rocky hillsides.
- *Acanthoproctus cervinus*. Found throughout area, but more commonly recorded at the plains fixed trap sites (Irish 1992).

4.5.13.3 Gryllidae (crickets)

Most crickets are alate and were not recorded, but five apterous morphospecies were recorded from pitfall traps. At least one belonged to the Mogoplistinae, a subfamily of tiny apterous crickets.

- Gryllidae species 1. Found at all fixed trap sites, but commoner at the plains and watercourse sites.
- Gryllidae species 2. Found mainly at plains and watercourse sites.
- Gryllidae species 3. Found only at plains and watercourse sites.
- Gryllidae species 4. Found in small numbers at most fixed trap sites.
- Gryllidae species 5. Two specimens from the Lower Ostrich Site only.

4.5.13.4 Lathiceridae (grasshoppers, no common name)

The family is near-endemic to Namibia

- *Crypsicerus cubicus*. Namibian endemic. Commonest at the plains sites, but a few recorded at the Panner Site as well (Irish 1988a).

4.5.13.5 Pamphagidae (grasshoppers, no common name)

Trachypetrella anderssonii. The widespread Toad Grasshopper was only found at the plains trap sites at Rössing (Irish & Roberts 2006). Also handsampled in block 1, which is consistent with plains.

4.5.13.6 Schizodactylidae (feather-toed crickets)

Comicus campestris. Namibian near-endemic. Found at all fixed trap sites, but most common at plains and watercourse sites (Irish 1986).

4.5.13.7 Tettigoniidae (long-horned grasshoppers)

Most tettigoniids are alate. The following three apterous morphospecies were encountered in very low numbers only. They may turn out to be nymphs of alate species.

- Tettigoniidae species 1. Found at rocky hillside and watercourse sites only, not on the plains.
- Tettigoniidae species 2. Only two specimens, from the Lower Dome site.
- Tettigoniidae species 3. Only one specimen, from the Lower Dome site.

4.5.13.8 Thericleidae (grasshoppers, no common name)

Thericles species. An apterous grasshopper, found in low numbers throughout area. The genus includes 4 species in Namibia.

4.5.14 Phasmatodea (stick insects)

A total of only 3 specimens were found, only at the two watercourse sites. The material was sorted into two morphospecies, but not identified further.

- Phasmatodea species 1.
- Phasmatodea species 2.

4.5.15 Psocoptera (book lice)

Includes both alate and apterous species. Not noted during survey, but known to have been handcollected in the area.

4.5.16 Siphonaptera (fleas)

A single flea was found in a pitfall trap at the Arandis Site. Since fleas are ectoparasites of vertebrates, it is presumed to have come from one of the rodents that occasionally fell into the preservative traps. They are probably found wherever their hosts occur.

4.5.17 Thysanoptera (thrips)

Found in pitfall traps, but alate and not treated further.

4.5.18 Thysanura (silverfish, fishmoths)

All the following belong to the family Lepismatidae.

- *Afrolepisma* species. Two specimens from pitfall traps at the Panner Site. At least 4 species are known from Namibia, but since they have not been revised yet, it is not possible to assign the specimens to a species. The genus is normally found in inland area, and is unexpected in the desert.
- *Ctenolepisma detritus*. A Central Namib endemic, described i.a. from Rössing material (Irish 1987a). Found at plains and watercourse sites, not on rocky hillsides. Also handsampled in blocks 1, 5 and 9, which is consistent with plains.
- *Ctenolepisma grandipalpis*. One specimen from a pitfall trap at the Lower Ostrich Site, also handsampled in block 4.
- *Ctenolepisma namibensis*. A Central Namib endemic, described in part on Rössing material (Irish 1987a). Found in pitfall traps at the Arandis and Lower Ostrich Sites only. Also handsampled in blocks 2, 5 and 9, which suggest a plains association. Its listing as a species of concern in Anon (no date, b) cannot be justified under the criteria followed here.
- *Ctenolepisma occidentalis*. Known only from the Rössing area, from material collected during the survey (Irish 1987a). Found mostly in pitfall traps at plains and watercourse sites. Also one specimen handsampled in block 13.
- *Ctenolepisma plusiochaeta*. Namibian endemic. Not recorded in pitfall traps. Handsampled once in block 3 (Irish 1987a).
- *Ctenolepisma* new species near *pauliani*. This species is only known from pitfall trap material collected during the Rössing survey (small numbers at the Arandis, Upper and Lower Ostrich Sites), but has never been described. Preservative pitfall trap material is sufficient to identify lepismatids, but generally too damaged to allow descriptions of new species. The species it most resembles, *C. pauliani*, is an endemic Namib dune specialist.
- *Ctenolepisma penrithae*. A Central Namib endemic. Found in small numbers at most sites, but commoner on rocky hillsides.
- *Monachina stilifera*. Recorded from the Arandis and Lower Ostrich Sites, and also handsampled in block 13 (Irish 1988b).
- *Thermobia aegyptiaca*. Common in pitfall traps only at rocky hillside sites (Irish 1988c). Also handsampled in block 4, which is consistent with this.
- *Thermobia nebulosa*. Namib endemic, described in part on Rössing material (Irish 1988c). Recorded from the Arandis, Upper and Lower Ostrich Sites. Since it is widespread throughout the Namib, its listing as a species of concern in Anon (no date, b) cannot be justified.
- *Thermobia vallis*. Not found in pitfall traps, but described in part on material that was handsampled in block 4 (Irish 1988c).

4.6. Amphibia (frogs)

Berger-Dell'Mour (1985) listed the following from the Rössing area, no specific localities given, not recorded in pitfall traps. Both are widespread elsewhere.

- *Poyntonophrynus hoeschi*. Toad.
- *Xenopus laevis*. Platanna.

Griffin (pers. comm.) adds the following.

- *Phrynomantis annectens*. Rubber Frog. Expected.

4.7. Reptilia (reptiles)

4.7.1 Agamidae (agamas)

Berger-Dell'Mour (1985) listed the following from the Rössing area, no specific localities given, not recorded in pitfall traps. Both are widespread elsewhere.

- *Agama anchietae*. Western Rock Agama.
- *Agama planiceps*. Namibian Rock Agama.

4.7.2 Chamaeleonidae (chamaeleons)

Chamaeleo namaquensis. Namaqua Chameleon. Recorded from the Upper Ostrich Site.

4.7.3 Colubridae (snakes)

- *Dipsina multimaculata*. Dwarf Beaked Snake. Recorded from the Arandis Site.
- *Lamprophis fuliginosus*. Brown House Snake. Recorded from the Upper Ostrich Site.
- *Psammophis namibiensis*. Namib Sand Snake. Recorded by Berger-Dell'Mour (1985), no site specified.
- *Psammophis trigrammus*. Western Whip Snake. Recorded by Berger-Dell'Mour (1985), no site specified.

4.7.4 Gekkonidae (geckos)

- *Chondrodactylus angulifer*. Giant Ground Gecko. Recorded from the Arandis Site.
- *Narudasia festiva*. Festive Gecko. Recorded from the Stockpile and Panner Sites.
- *Chondrodactylus turneri*. Button-scale Gecko. Recorded from the Upper Ostrich Site.
- *Pachydactylus bicolor*. Velvety Gecko. Recorded from the Arandis Site.
- *Pachydactylus kochii*. Namib Ghost Gecko. Recorded from the Panner Site.
- *Pachydactylus punctatus*. Speckled Gecko. Recorded from the Upper and Lower Ostrich, Panner and Arandis Sites. Griffin (pers. comm.) is

of the opinion that these are more likely referable to *Pachydactylus scherzi*, the Namib Variable Gecko.

- *Pachydactylus weberi weneri*. Weber's Gecko. Recorded from the Stockpile Site.
- *Ptenopus garrulus*. Common Barking Gecko. Recorded from the Upper and Lower Ostrich, Arandis and Panner Sites. Especially numerous at the watercourse sites.
- *Rhoptropus afer*. Namib Day Gecko. Recorded mostly from the Upper Ostrich Site, occasionally at the Arandis and Lower Ostrich Sites.
- *Rhoptropus barnardi*. Barnard's Namib Day Gecko. Listed by Berger-Dell'Mour (1985), but no sites specified.
- *Rhoptropus bradfieldi*. Bradfield's Namib Day Gecko. Recorded from the Lower Dome, Stockpile, Panner and Lower Ostrich Sites.
- *Lygodactylus bradfieldi*. Namibian Dwarf Gecko. Expected.

4.7.5 Gerrhosauridae (plated lizards)

Cordylosaurus subtessellatus. Dwarf Plated Lizard. Recorded from the Lower Ostrich Site.

4.7.6 Lacertidae (lizards)

- *Meroles suborbitalis*. Spotted Sand Lizard. Recorded from the Upper Ostrich, Arandis and Lower Ostrich Sites.
- *Meroles sp. nov.* Recently identified from the area east of Swakopmund and may occur in the Rössing area.
- *Pedioplanis breviceps*. Short-headed Sand Lizard. Recorded from the Upper Ostrich, Arandis and Lower Ostrich Sites.
- *Pedioplanis husabensis*. Husab Sand Lizard. Recorded from Lower Dome, Stockpile, Panner and Lower Ostrich Sites, but commonest at the former two (rocky hillsides). This species was first discovered during the Rössing project (Berger-Dell'Mour & Mayer, 1989). It is a Central Namib endemic only found in a restricted area around the Lower Swakop and Khan Rivers.
- *Pedioplanis namaquensis*. Namaqua Sand Lizard. Listed by Berger-Dell'Mour (1985), but no sites specified.
- *Pedioplanis undata*. Western Sand Lizard. Recorded from the Upper Ostrich, Arandis and Lower Ostrich Sites.

4.7.7 Leptotyphlopidae (worm snakes)

- *Leptotyphlops occidentalis*. Namibian Worm Snake. Recorded from the Upper Ostrich, Arandis and Panner Sites, especially common at the latter.

4.7.8 Scincidae (skinks)

- *Trachylepis acutilabris*. Wedge-snouted Skink. Listed by Berger-Dell'Mour (1985), but no sites given.

- *Trachylepis hoeschi*. Western Rock Skink. Recorded from the Stockpile, Panner and Lower Ostrich Sites.
- *Trachylepis occidentalis*. Western Three-lined Skink. Recorded from the Upper Ostrich, Arandis, Panner and Lower Ostrich Sites.
- *Trachylepis spilogaster*. Namibian Tree Skink. Listed by Berger-Dell'Mour (1985), but no sites given – probably Khan River.
- *Trachylepis sulcata*. Koppie Skink. Listed by Berger-Dell'Mour (1985), but no sites given.
- *Trachylepis variegata*. Western Variegated Skink. Recorded from the Arandis and Panner Sites.
- *Scelotes capensis*. Namibian Dwarf Burrowing Skink. Record based on a photograph taken by J. Irish between Arandis Town and Arandis Site, identified by M. Griffin.

4.7.9 Typhlopidae (blind snakes)

Rhinotyphlops lalandei. Delalande's Blind Snake. Recorded from the Upper Ostrich Site.

4.7.10 Viperidae (adders)

- *Bitis caudalis*. Horned Adder. Recorded from the Arandis Site.

4.7.11 Atractaspididae (burrowing asps)

- *Atractaspis bibronii*. Southern Stilleto Snake. Expected.

4.8. Aves (birds)

The following birds were recorded by either Colahan (1987) or Komen (undated checklist on file at RUL), or both.

- *Agapornis roseicollis*. Rosy-faced Lovebird.
- *Amadina erthrocephala*. Red-headed Finch.
- *Ammomanopsis grayi*. Gray's Lark.
- *Anthus cinnamomeus*. African Pipit.
- *Anthus similis*. Long-billed Pipit.
- *Apus affinis*. Little Swift.
- *Apus apus*. Common Swift.
- *Apus bradfieldi*. Bradfield's Swift.
- *Aquila verreauxii*. Verreaux's Eagle.
- *Batis pririt*. Pririt Batis.
- *Bradornis infuscatus*. Chat Flycatcher.
- *Bradornis mariquensis*. Marico Flycatcher.
- *Bubo africanus*. Spotted Eagle Owl.
- *Burhinus capensis*. Spotted Thick-knee.
- *Calendulauda africanoides*. Fawn-coloured Lark.
- *Calendulauda sabota*. Sabota Lark.
- *Cercomela familiaris*. Familiar Chat.

- *Cercomela schlegelii*. Karoo Chat.
- *Cercomela tractrac*. Tractrac Chat.
- *Cercotrichas paena*. Kalahari Scrub Robin.
- *Certhilauda subcoronata*. Karoo Long-billed Lark.
- *Chersomanes albofasciata*. Spike-heeled Lark.
- *Cinnyris fuscus*. Dusky Sunbird.
- *Circaetus pectoralis*. Black-chested Snake-Eagle.
- *Cisticola subruficapilla*. Grey-backed Cisticola.
- *Colius colius*. White-backed Mousebird.
- *Columba livia*. Rock Dove (Feral Pigeon).
- *Columba guinea*. Speckled Pigeon.
- *Corvus albus*. Pied Crow.
- *Corvus capensis*. Cape Crow.
- *Crithagra albogularis*. White-throated Canary.
- *Crithagra atrogularis*. Black-throated Canary.
- *Cursorius rufus*. Burchell's Courser.
- *Dicrurus adsimilis*. Fork-tailed Drongo.
- *Emberiza capensis*. Cape Bunting.
- *Emberiza impetuani*. Lark-like Bunting.
- *Emberiza tahapisi*. Cinnamon-breasted Bunting.
- *Eremomela gregalis*. Karoo Eremomela.
- *Eremomela icteropygialis*. Yellow-bellied Eremomela.
- *Eremopterix verticalis*. Grey-backed Sparrowlark.
- *Estrilda astrild*. Common Waxbill.
- *Eupodotis ruepellii*. Ruppell's Korhaan.
- *Falco biarmicus*. Lanner Falcon.
- *Falco rupicoloides*. Greater Kestrel.
- *Falco tinnunculus*. Rock Kestrel.
- *Granatina granatina*. Violet-eared Waxbill.
- *Hirundo fuligula*. Rock Martin.
- *Hirundo rustica*. Barn Swallow.
- *Lamprotornis nitens*. Cape Glossy Starling.
- *Lanius collaris*. Common Fiscal.
- *Malcorus pectoralis*. Rufous-eared Warbler.
- *Melierax canorus*. Southern Pale Chanting Goshawk.
- *Merops hirundineus*. Swallow-tailed Bee-eater.
- *Monticola brevipes*. Short-toed Rock Thrush.
- *Nilaus afer*. Brubru.
- *Numida meleagris*. Helmeted Guineafowl.
- *Oena capensis*. Namaqua Dove.
- *Oenanthe monticola*. Mountain Wheatear.
- *Oenanthe pileata*. Capped Wheatear.
- *Onychognathus nabouroup*. Pale-winged Starling.
- *Parisoma layardi*. Layard's Tit-babbler.
- *Parisoma subcaeruleum*. Chestnut-vented Titbabbler.
- *Parus carpi*. Carp's Tit.
- *Parus cinerascens*. Ashy Tit.

- *Passer diffusus*. Southern Grey-headed Sparrow.
- *Passer domesticus*. House Sparrow.
- *Passer melanurus*. Cape Sparrow.
- *Plocepasser mahali*. White-browed Sparrow-Weaver.
- *Ploceus velatus*. Southern Masked Weaver.
- *Prinia flavicans*. Black-chested Prinia.
- *Pterocles bicinctus*. Double-banded Sandgrouse.
- *Pterocles namaqua*. Namaqua Sandgrouse.
- *Pycnonotus nigricans*. African Red-eyed Bulbul.
- *Riparia paludicola*. Brown-throated Martin.
- *Rhinoptilus africanus*. Double-banded Courser.
- *Spizocorys starki*. Stark's Lark.
- *Sporopipes squamifrons*. Scaly-feathered Finch.
- *Streptopelia capicola*. Cape Turtle Dove.
- *Streptopelia senegalensis*. Laughing Dove.
- *Struthio camelus*. Common Ostrich.
- *Sylvietta rufescens*. Long-billed Crombec.
- *Tachymarptis melba*. Alpine Swift.
- *Telophorus zeylonus*. Bokmakierie.
- *Tricholaema leucomelas*. Acacia Pied Barbet.
- *Tyto alba*. Barn Owl.
- *Vanellus coronatus*. Crowned Lapwing.
- *Zosterops pallidus*. Orange River White-eye.

From the same sources, the following wetland birds were associated with open water either on the mine or at the Arandis sewerage works.

- *Actitis hypoleucos*. Common Sandpiper.
- *Acrocephalus baeticatus*. African Reed-Warbler.
- *Alopochen aegyptiaca*. Egyptian Goose.
- *Amaurornis flavirostris*. Black Crake.
- *Anas capensis*. Cape Teal.
- *Anas erythrorhyncha*. Red-billed Teal.
- *Anas hottentota*. Hottentot Teal.
- *Anas smithii*. Cape Shoveller.
- *Ardea cinerea*. Grey Heron.
- *Ardea melanocephala*. Black-headed Heron.
- *Calidris minuta*. Little Stint.
- *Charadrius hiaticula*. Common Ringed Plover.
- *Charadrius marginatus*. White-fronted Plover.
- *Charadrius pecuarius*. Kitlitz's Plover.
- *Charadrius tricollaris*. Three-banded Plover.
- *Fulica cristata*. Red-knobbed Coot.
- *Gallinula chloropus*. Common Moorhen.
- *Himantopus himantopus*. Black-winged Stilt.
- *Motacilla capensis*. Cape Wagtail.
- *Netto erythrophthalma*. Southern Pochard.
- *Oxyura maccoa*. Maccoa Duck.

- *Pelecanus onocrotalus*. Great White Pelican.
- *Phalacrocorax africanus*. Reed Cormorant.
- *Philomachus pugnax*. Ruff.
- *Phoenicopterus ruber*. Greater Flamingo.
- *Phoenicopterus minor*. Lesser Flamingo.
- *Podiceps nigricollis*. Black-necked Grebe.
- *Recurvirostra avosetta*. Pied Avocet.
- *Tachybaptus ruficollis*. Little Grebe.
- *Tadorna cana*. South African Shelduck.
- *Tringa glareola*. Wood Sandpiper.
- *Tringa nebularia*. Common Greenshank.
- *Tringa stagnatilis*. Marsh Sandpiper.
- *Vanellus armatus*. Blacksmith Lapwing.
-

4.9. Mammalia (mammals)

The following were recorded during the small mammal trap survey.

- *Aethomys namaquensis*. Namaqua Rock Rat. Found at the Panner and Lower Ostrich Sites only.
- *Crociodura cyanea*. Reddish-grey Musk Shrew. One specimen from an invertebrate trap at the Stockpile Site only.
- *Desmodillus auricularis*. Short-tailed Gerbil. Found at the Panner, Upper and Lower Ostrich Sites only.
- *Gerbillurus paeba*. Pygmy Gerbil. Common at the Arandis Site, occasionally at the Panner and Upper Ostrich Sites.
- *Gerbillurus setzeri*. Namib Brush-tailed Gerbil. Common at the Arandis, Panner, Upper and Lower Ostrich Sites.
- *Macroscelides proboscideus*. Round-eared Elephant Shrew. Found at the Arandis, Upper Ostrich and Lower Dome sites only.
- *Petromyscus collinus*. Namibian Pygmy Rock Mouse. Recorded by the mammal survey at the Panner Site only, but also found in invertebrate traps at the Arandis, Stockpile, Lower Dome and Lower Ostrich Sites.
- *Rhabdomys pumilio*. Three-striped Mouse. One specimen from an invertebrate trap at the Panner Site only.
- *Thallomys paedulcus*. Tree Rat. Found at the Lower Ostrich Site only.

4.10. Micro-plants

Archibald (1987) reported 36 diatom taxa from Rössing water samples, emanating from the limnological survey, but they were listed by sample numbers only, lacking localities. Some taxa were stated to be endemic to Namibia, but none were specific to the Rössing area.

Algae are mentioned in the limnological survey notes.

4.11. Lichens

Anon (no date, a) mentions 2 unidentified lichens.

4.12. Plants

Occurrence at survey and other sites of interest (as per specimens in Herbarium database) were specifically mentioned below.

4.12.1 Acanthaceae

- *Blepharis bossii*. Listed in Anon (no date, a), no localities.
- *Blepharis grossa*. Arandis, Lower Dome and Stockpile Sites. Also Khan Mine.
- *Blepharis obmitrata*. Lower Dome Site.
- *Doellia caffra*.
- *Monechma cleomoides*. Lower Dome, Lower Ostrich, Stockpile and Upper Ostrich Sites. Also 'Northeast of mine'.
- *Monechma debile*. Arandis
- *Monechma desertorum*. Upper Ostrich Site.
- *Monechma genistifolium*. Arandis Site.
- *Petalidium canescens*. Panner and Stockpile Sites. Also 'Mining area'.
- *Petalidium lanatum*. Arandis.
- *Petalidium variabile*. Lower Ostrich, Panner and Stockpile Sites.
- *Ruellia diversifolia*. Khan Mine and Mining Area.

4.12.2 Aizoaceae

- *Aizoanthemum dinteri*. Lower Dome Site.
- *Aizoanthemum membrumconnectens*. Listed in Anon (no date, a), no localities.
- *Galenia africana*. Arandis and along main road.
- *Galenia meziana*. Listed in Anon (no date, a), no localities.
- *Sesuvium sesuvioides*. Arandis area, Khan Mine, Mining area, Panner and Upper Ostrich Sites.
- *Tetragonia reduplicata*. Panner Site, also near mine gate.
- *Trianthema parvifolia*. Stockpile Site, also Mining Area.

4.12.3 Amaranthaceae

- *Arthraerua leubnitziae*. Arandis, Panner and Upper Ostrich Sites.
- *Calicorema capitata*. Arandis.
- *Hermbstaedtia argenteiformis*. Khan River.
- *Hermbstaedtia spathulifolia*. Lower Dome and Panner Sites.
- *Sericocoma heterochiton*. Mine area.
- *Sericorema sericea*. Panner Site.

4.12.4 Anacardiaceae

- *Rhus marlothii*. Arandis area, Khan River valley.

4.12.5 Apocynaceae

- *Cryptolepis decidua*. Arandis and Stockpile Sites.

- *Gomphocarpus filiformis*. Arandis Mountain, along Main road, Upper Ostrich Site.
- *Hoodia currorii*. Arandis.
- *Hoodia gordonii*. Listed in Anon (no date, a), no localities.
- *Larryleachia marlothii*. Arandis.
- *Orthanthera albida*. Arandis, Stockpile Site.
- *Pergularia daemia*. Lower Dome Site, mining area.
- *Sarcostemma viminale*. Arandis area.

4.12.6 Asparagaceae

- *Asparagus pearsonii*. Arandis, Stockpile Site, Upper Ostrich Site.

4.12.7 Asphodelaceae

- *Aloe asperifolia*. Many records from the Arandis area.
- *Aloe dichotoma*. SK area.
- *Aloe namibiensis*. Arandis.
- *Trachyandra laxa*. Arandis.

4.12.8 Asteraceae

- *Berkeya spinosissima*. Khan River.
- *Calostephane marlothiana*. Mining area.
- *Dauresia alliariifolia*. Lower Dome Site, Stockpile Site, Mining area.
- *Doellia caffra*. Northeast of mine.
- *Emilia marlothiana*. Fish Factory, Stockpile Site.
- *Felicia anthemidodes*. Khan Mine, Panner Site.
- *Flaveria bidentis*. Alien. Main road near mine.
- *Foveolina dichotoma*. Northwest of mine.
- *Gazania jurineifolia*. Arandis.
- *Geigeria ornativa*. Arandis, Lower Dome Site, Khan mine, mining area.
- *Helichrysum roseo-niveum*. Lower Ostrich Site, Upper Ostrich Site
- *Kleinia longiflora*. Upper Ostrich Site.
- *Launaea intybacea*. Northeast of mine.
- *Myxopappus acutilobus*. Khan Mine.
- *Myxopappus hereroensis*. Mining area.
- *Nolletia arenosa*. Khan Mine.
- *Nolletia gariepina*. Listed by Anon (no date, a), no localities.
- *Othonna lasiocarpa*. Arandis.
- *Pechuel-Loeschea leubnitziae*. Khan River.
- *Tripteris microcarpa*. Arandis, Mining area.

4.12.9 Boraginaceae

- *Cordia sinensis*. Arandis, and Main road northeast of mine.
- *Heliotropium albiflorum*. Upper Ostrich Site.
- *Heliotropium ovalifolium*. East of mine.
- *Heliotropium tubulosum*. Arandis, along main road, northeast of mine, Panner Site, Upper Ostrich Site.
- *Trichodesma africanum*. Lower Ostrich Site, Khan River.

4.12.10 Burseraceae

- *Commiphora glaucescens*. Arandis area.
- *Commiphora oblanceolata*. Khan River. This is a tiny isolated population, widely separated from the main distribution area in Kaokoland (Curtis & Mannheimer 2005).
- *Commiphora saxicola*. Arandis, Khan Mine, Lower Ostrich Site, Stockpile Site.
- *Commiphora tenuipetiolata*. Arandis Area, Lower Dome Site.
- *Commiphora virgata*. Arandis area.

4.12.11 Capparaceae

- *Boscia albitrunca*. Listed by Anon (no date, a), no localities.
- *Boscia foetida*. Records from Arandis and Khan Mine, but found throughout.
- *Cleome foliosa*. Arandis, Arandis Airport, Lower Dome Site, Khan Mine.
- *Cleome suffruticosa*. Arandis Airport, Khan River.
- *Maerua schinzii*. Khan River valley.

4.12.12 Caryophyllaceae

- *Spergularia media*. Arandis. Alien.

4.12.13 Celastraceae

- *Gymnosporia buxifolia*. Listed in Anon (no date, a), no localities.
- *Gymnosporia senegalensis*. Arandis.

4.12.14 Chenopodiaceae

- *Chenopodium amboanum*. Mining area.
- *Chenopodium ambrosioides*. Alien. Listed in Anon (no date, a), no localities.
- *Chenopodium murale*. Stockpile Site.
- *Lophiocarpus polystachyus*. Mining area.
- *Salsola kali*. Alien. Mining area.
- *Salsola tuberculatiformis*. Arandis. (Indigenous *Salsola* does occur in the Rössing area, but the taxonomy of the genus in Namibia is in disarray. Therefore this identification should be treated with caution – other *Salsola* species may occur in the area as well).
- *Suaeda plumosa*. Arandis.

4.12.15 Convolvulaceae

- *Ipomoea adenioides*. Listed in Anon (no date, a), no localities.

4.12.16 Crassulaceae

- *Cotyledon orbiculata*. Listed in Anon (no date, a), no localities.

4.12.17 Cucurbitaceae

- *Citrullus ecirrhosus*. Khan Mine, Mining area.
- *Corallocarpus dissectus*. Listed in Anon (no data), no localities.
- *Corallocarpus schinzii*. Arandis area.

- *Cucumella aspera*. Lower Dome Site, but probably in riverbed next to site, not on hills.
- *Cucumis africanus*. Mining area.
- *Cucumis meeusei*. Lower Dome Site, but probably in riverbed next to site, not on hills.

4.12.18 Cyperaceae

- *Cyperus laevigatus*. Panner Site. Associated with open water.
- *Cyperus marginatus*. Arandis sewerage works. Associated with open water.

4.12.19 Ebenaceae

- *Euclea pseudebenus*. Khan River.

4.12.20 Eriospermaceae

- *Eriospermum bakerianum*. Listed in Anon (no date, a), no localities.
- *Eriospermum rautanenii*. Arandis.

4.12.21 Euphorbiaceae

- *Euphorbia damarana*. Main road E of Arandis, also NW of tailings dam.
- *Euphorbia gariepina*. Khan Mine.
- *Euphorbia giessii*. Near security gate.
- *Euphorbia glanduligera*. Arandis, Lower Dome Site, mining area.
- *Euphorbia phylloclada*. Arandis, Lower Dome Site, mining area.
- *Euphorbia virosa*. Listed in Anon (no date, a), no localities.
- *Ricinus communis*. Listed by Anon (no date, a), no localities. Alien.

4.12.22 Fabaceae

- *Acacia albida*. Khan River.
- *Acacia erioloba*. Lower Ostrich Site, Panner Site.
- *Acacia reficiens*. Upper Ostrich Site, Panner Site.
- *Acacia tortilis*. Khan River.
- *Adenolobus garipensis*. Khan River.
- *Adenolobus pechuellii*. Arandis Site, Lower Dome Site, Khan Mine, Lower Ostrich Site, Panner Site, Stockpile Site, Upper Ostrich Site.
- *Indigostrum argyroides*. Khan Mine.
- *Indigofera adenocarpa*. Northeast of mine.
- *Indigofera auricoma*. Arandis, Khan Mine, Stockpile Site.
- *Lotononis platycarpa*. Arandis.
- *Microcharis disjuncta*. Arandis.
- *Parkinsonia africana*. Lower Ostrich Site, Panner Site.
- *Sesbania pachycarpa*. Arandis, Mining area.
- *Tephrosia dregeana*. Arandis, Mining area, Northeast of mine, Panner Site, Stockpile Site.

4.12.23 Gerianaceae

- *Monsonia luedritziana*. Mining area.
- *Monsonia umbellata*. Arandis.

- *Pelargonium otaviense*. West of Arandis.
 - *Sarcocaulon marlothii*. Arandis Site, Panner Site, Stockpile Site.
 - *Sarcocaulon salmoniflorum*. Listed in Anon (no date, a), no localities.
- 4.12.24 Gisekiaceae
- *Gisekia africana*. Arandis, Khan Mine.
- 4.12.25 Hyacinthaceae
- *Dipcadi bakerianum*. Arandis.
 - *Dipcadi platyphyllum*. Arandis.
 - *Ornithogalum stapfii*. Arandis.
- 4.12.26 Hydnoraceae
- *Hydnora africana*. Listed in Anon (no date, a), no localities.
- 4.12.27 Hydrophyllaceae
- *Codon royenii*. Arandis.
 - *Codon schenckii*. Lower Ostrich Site, Panner Site.
- 4.12.28 Lemnaceae
- *Lemna aequinoctialis*. Aquatic plant. Seepage in mining area.
- 4.12.29 Loasaceae
- *Kissenia capensis*. Panner Site.
- 4.12.30 Lobeliaceae
- *Lobelia erinus*. Khan River.
- 4.12.31 Loranthaceae
- *Tapinanthus oleifolius*. Arandis area.
- 4.12.32 Lythraceae
- *Ammannia wormskioldii*. Listed in Anon (no date, a), no localities.
 - *Nesaea sarcophylla*. Khan River.
- 4.12.33 Malvaceae
- *Abutilon pycnodon*. Lower Dome Site.
- 4.12.34 Mesembryanthemaceae
- *Brownanthus kuntzei*. Panner Site, Stockpile Site.
 - *Lithops ruschiorum*. Mining area. Species currently the subject of intensive study (Loots, pers. comm.).
 - *Mesembryanthemum guerichianum*. Lower Dome Site, Khan Mine, Mining area.
 - *Psilocaulon salicornioides*. Arandis area, Panner Site, Stockpile Site.
- 4.12.35 Molluginaceae
- *Limeum argute-carinatum*. Arandis.
 - *Mollugo cerviana*. Lower Dome Site.

- 4.12.36 Moringaceae
- *Moringa ovalifolia*. Khan River valley.
- 4.12.37 Nyctaginaceae
- *Boerhavia hereroensis*. Listed by Anon (no date, a), no localities.
 - *Commicarpus squarrosus*. Khan Mine, Panner Site.
- 4.12.38 Ophioglossaceae (fern)
- *Ophioglossum polyphyllum*. Arandis.
- 4.12.39 Papaveraceae
- *Argemone ochroleuca*. Alien. Arandis, Khan River.
- 4.12.40 Passifloraceae
- *Adenia pechuelii*. Stockpile Site. Currently under study (Loots, pers. comm.).
- 4.12.41 Pedaliaceae
- *Sesamum capense*. Arandis, Stockpile Site.
 - *Sesamum marlothii*. Near gate, Khan Mine, Panner Site.
 - *Sesamum schinzianum*. Stockpile Site.
- 4.12.42 Plumbaginaceae
- *Dyerophytum africanum*. Arandis.
- 4.12.43 Poaceae
- *Aristida parvula*. Arandis, Stockpile Site.
 - *Brachiaria glomerata*. Khan Mine, Lower Ostrich Site, Stockpile Site.
 - *Cynodon dactylon*. Alien. Around seepage ponds.
 - *Enneapogon desvauxii*. Arandis, Lower Ostrich Site, Stockpile Site.
 - *Enneapogon scaber*. Stockpile Site.
 - *Eragrostis macrochlamys*. Khan Mine.
 - *Eragrostis nindensis*. Arandis.
 - *Phragmites australis*. Mining area, Panner Site. Water-associated. Also mentioned in limnology reports.
 - *Paspalum vaginatum*. Listed by Anon (no date, a), no locations. Alien.
 - *Setaria verticillata*. Lower Dome Site
 - *Sporobolus consimilis*. Khan River.
 - *Sporobolus nebulosus*. Arandis, Khan Mine, Mining area.
 - *Stipagrostis ciliata*. Mining area, Stockpile Site, Upper Ostrich Site.
 - *Stipagrostis damarensis*. Mining area, Upper Ostrich Site.
 - *Stipagrostis dinteri*. Khan Mine, Mining area, Stockpile Site.
 - *Stipagrostis hermannii*. Arandis.
 - *Stipagrostis hirtigluma*. Arandis, Khan Mine.
 - *Stipagrostis hochstetteriana*. Arandis.
 - *Stipagrostis namaquensis*. Listed in Anon (no date, a), no localities. Occurrence plausible.

- *Stipagrostis obtusa*. Arandis.
 - *Stipagrostis schaeferi*. Khan Mine, Mining area, Panner Site.
 - *Stipagrostis subacualis*. Arandis.
 - *Stipagrostis uniplumis*. Arandis.
- 4.12.44 Polygalaceae
- *Polygala guerichiana*. Khan Mine, Mining area, Upper Ostrich Site.
 - *Polygala pallida*. Mining area.
- 4.12.45 Polygonaceae
- *Polygonum plebeium*. Northeast of mine.
- 4.12.46 Portulacaceae
- *Anacampseros albissima*. Listed in Anon (no date, a), no localities.
- 4.12.47 Rubiaceae
- *Kohautia cynanchica*. Arandis.
- 4.12.48 Ruppiaceae
- *Ruppia maritima*. Panner Site. Water associated. Also mentioned in limnology reports.
- 4.12.49 Salvadoraceae
- *Salvadora persica*. Arandis area, Khan Mine, Lower Ostrich Site.
- 4.12.50 Scrophulariaceae
- *Anticharis ebracteata*. Arandis.
 - *Anticharis imbricata*. Khan Mine.
 - *Anticharis inflata*. Arandis area.
 - *Aptosimum lineare*. Arandis Site.
 - *Diclis petiolaris*. Khan River.
 - *Jamesbrittenia canescens*. Listed in Anon (no date, a), no localities.
 - *Jamesbrittenia hereroensis*. Lower Dome Site, mining area.
 - *Jamesbrittenia maxii*. Arandis, Lower Dome Site, along main road.
 - *Manulea dubia*. Arandis.
- 4.12.51 Solanaceae
- *Datura innoxia*. Alien. Khan River.
 - *Nicotiana glauca*. Alien. Khan River
 - *Solanum rigescentroides*. Arandis, Lower Dome Site.
- 4.12.52 Sterculiaceae
- *Hermannia affinis*. Arandis, Stockpile Site, Upper Ostrich Site.
 - *Hermannia amabilis*. Lower Dome Site, Khan Mine.
 - *Hermannia complicata*. Arandis.
 - *Hermannia glandulosissima*. Arandis.
 - *Hermannia helianthemum*. Along main road, mining area.
 - *Hermannia modesta*. Arandis.

- *Hermannia solaniflora*. Arandis.
 - *Sterculia africana*. Khan River valley.
- 4.12.53 Tamaricaceae
- *Tamarix usneoides*. Khan River, Panner Site.
- 4.12.54 Tiliaceae
- *Grewia tenax*. Northeast of mine.
- 4.12.55 Typhaceae
- *Typha capensis*. Water associated. Also mentioned in limnology reports.
- 4.12.56 Urticaceae
- *Forrskaolea candida*. Stockpile Site.
 - *Forrskaolea hereroensis*. Mining area.
- 4.12.57 Vahliaceae
- *Vahlia capensis*. Listed in Anon (no date, a), no localities.
- 4.12.58 Verbenaceae
- *Chascanum garipense*. Lower Dome Site, Fish Factory, Khan Mine.
- 4.12.59 Viscaceae
- *Viscum rotundifolium*. Listed in Anon (no date, a), no localities.
- 4.12.60 Zygophyllaceae
- *Fagonia isotricha*. Khan Mine.
 - *Fagonia sinaica*. Khan Mine.
 - *Tribulus zeyheri*. Khan River.
 - *Zygophyllum cylindrifolium*. Arandis Site.
 - *Zygophyllum simplex*. Arandis, Mining area.
 - *Zygophyllum stapfii*. Arandis Site, Lower Ostrich Site, Stockpile Site, Upper Ostrich Site.

5. ACKNOWLEDGEMENTS

Former colleagues who participated in the 1984 survey are thanked for kindly allowing the use of their unpublished data: Hartwig Dell'Mour (reptiles), Brian Colahan (mammals and birds), Eryn Griffin (arachnids) and Joris Komen (birds). Current National Museum staff who facilitated access to historical files and collection data include: Tharina Bird, Benson Muramba, Hermine Inana-Uusuku, Mathilda Awases and Seth Eiseb. Mike Griffin is thanked for updated reptile information, and Leon Lotz for updated information on Sicariidae. Help with matters botanical was supplied by the staff of the National Herbarium and the National Botanical Research Institute in general, and Esmeralda Klaassen in particular. Rainer Schneeweiss is thanked for facilitating access to RUL archives relating to the Rössing Survey, and for the opportunity to revisit the Stockpile Site.

Specifically with regards to the Entomology survey, the help and support of staff members Hella Rust, Judith Dias and Mathilda Awases significantly contributed towards its successful conclusion. Some insect voucher specimens were identified by Dr. Schalk Louw (Curculionidae), Dr. Mary-Louise Penrith (Tenebrionidae) and the late Dr. Sebastian Endrödy-Younga (Tenebrionidae).

SUMMARY OF THE 2007 BIODIVERSITY SAMPLING WORK IN THE RÖSSING AREA, CENTRAL NAMIB DESERT

J. Irish, D.Aiyambo, K. Eelu, J.Guittar, J. Henschel, R. Kavari, V. Nghitombo, J.Pallett, J. Shikangala and V. Siteteka

1. INTRODUCTION

The three sites of immediate concern to RUL (SK4 area as the next to be mined, SH area to be mined in future, and Dome area as a potential dump site) were not included in the 1984/85 baseline biodiversity survey. In order to place them into that context, and to have firsthand experience of both biodiversity and general environmental conditions at these three sites, biodiversity sampling fieldwork was conducted there during October 2007.

2. SAMPLING SITES

The locations of sites are mapped in Figure B1, and GPS-references are listed in Table B2.

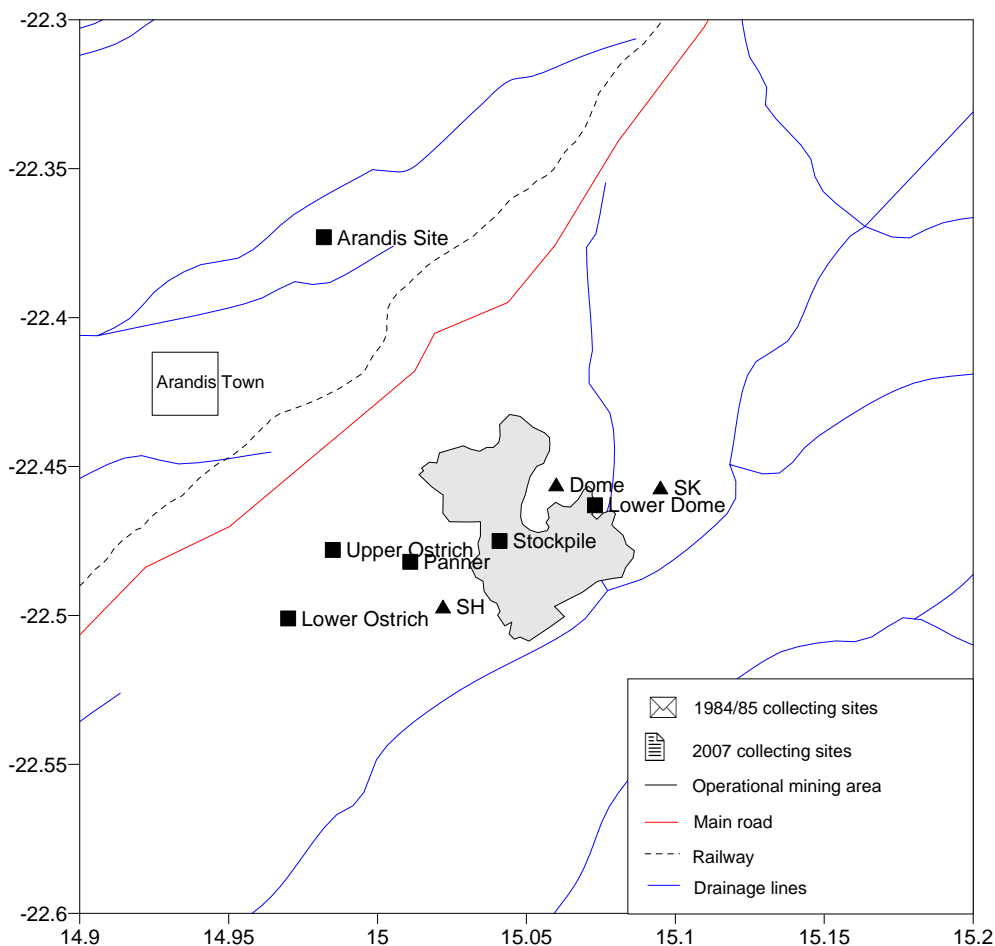

Figure 1. Location of the 2007 sampling sites in the Rössing area, with 1984/85 sites for comparison.

Table 1. Coordinates of central points in each sampling area.

Site	Longitude °E	Latitude °S	Notes
------	--------------	-------------	-------

SK sampling site	15.095	22.457	GPS
SH sampling site	15.022	22.497	GPS
Dome area	15.06	22.456	GPS
sampling site	GUESSWORK: TO BE VERIFIED		

SK sampling site

Ongoing drilling operations in SK4 rendered sampling on the actual spot to be mined impractical, and the selected site was located 1.6 km northeastwards. The working area was roughly square with 600m sides (Fig *).

The topography at the sampling site was similar to that found at SK4, namely extremely rugged slopes and dissected landscape, with the rocky outcrops and scree slopes being separated by deeply incised and very thin rocky washes or slightly more conspicuous washes with sandy alluvium. Very little of either site is flat or even.

The geology at the sampling site is also similar to that at SK4, since it is located along the strike of the rock, in the same geological formations that are present at SK4. The rocky slopes comprised loose rubble and rocks, gravel and fine-grained material, without clear boundaries between areas of actual rock outcrop and the debris-strewn slopes below. There was much mixing of rock types on the scree depending on the geology of the outcrops above. Consequently it was not possible to accurately classify the rocks and debris that comprised the rocky slopes for the purpose of habitat categorisation of the biota encountered there. The habitat was simply named rocky hillsides. These slopes and the outcrops contained many cracks, crevices and overhangs, all of which provided refuge and sheltering places for small animals. Lizards and insects were frequently seen occupying such crevices and shelters.

There was a sparse scatter of plants on the slopes. These comprised many small *Zygophyllum simplex* plants, rather few grass tufts, dormant *Geigeria* stems, *Psilocaulon* sp and dead *Blepharis* remnants. **Pic64 plant?** The only plants that appeared to be providing food on the slopes were *Adenolobus pechuellii*, which in most cases were browsed to just a few bare stems. Less common were occasional *Hermannia amabilis* herbs (in flower), and rare *Orphanthera*. Scattered *Adenia pechuellii* plants were found and all were photographed and GPSed (**see separate Adenia maps**). In one area of about 50m diameter were five *Aloe dichotoma* trees.

In certain areas many *Sarcocaulon marlothii* (Bushman's candle) were observed, particularly on S-facing slopes. Many were dead or appeared close to it, with their branches lying flat on the ground and the central trunk split open. Spot surveys done in two places on the slope recorded 15 dead and 15 alive **Pics 277, 321-324.**

In the sandy washes were a few *Parkinsonia africana* trees and very rare *Commiphora glaucescens* trees.

PICS OF AREA

SH sampling site

As for SK, a roughly square study area with 600m sides was selected. Geology and topography in the SH area was generally similar to SK, but the river washes were wider and more pronounced, giving more space between the rocky outcrops and slopes. Outcrops comprised granite, schist and marble, and rocky slopes had mixtures of these rock types. Plant life on the rocky slopes was similar to that at SK.

Plant life in the wide washes and the areas of plain that separated washes from rocky slopes, was more prolific than in SK. There were scattered trees, mainly *Acacia erioloba*, and a few dense clumps of *Salvadora* bush. The gentle slopes and river washes also hosted many small *Blepharis* plants. Bird life in the SH area was more common than in SK, and the presence of springbok, kudu and ostrich also indicated greater availability of food to support these large animals. A saline spring immediately north of the study area, known as 'Piet se gat', acted as an attraction to birds and mammals in the area.

PICS OF AREA

Dome sampling site

The camp site was located in Dome Gorge, an alluvial river bed located about 2 km from the entrance to Rossing Mine. The study area described a rough square with 600m sides that included this and the neighbouring alluvial wash, and the mountainous area in between. Dome topography was more gentle than at SK or SH, with less steep slopes and less rock-strewn scree slopes, comprising mainly granite rocks and debris. This habitat was classified as 'rocky hillsides'.

Plant life at Dome was more prolific than at the other two sites. Hillsides and slopes hosted individuals of the following species: *Euphorbia virosa*, *Euphorbia damarana*, *Commiphora saxicola*, *Commiphora virgata*, *Zygophyllum stapfii*, *Calicorema capitata* and *Adenolobus pechuellii*, with some rare *Boscia foetida* low bushy trees. *Salvadora* bushes, *Tamarix usneoides* and *Euclea pseudebenus* trees occurred in the river bed, as well as numerous *Zygophyllum stapfii* and 10c bushes. *Adenia pechuellii* plants were relatively common compared to SK and SH, living on rocky outcrops and slopes. All *Adenias* were GPSed and photographed. Some of them appeared to be dying, with many dried out, grey-black stems and very few greenish ones. Two dead *Adenias* were found in the study area.

3. METHODS AND FOCAL TAXA

Different participants had ultimate responsibility for different components of the sampling, but the overall survey was a collaborative effort, and all participants contributed observations and specimens to all components.

[Where do we add Johanna's work?]

Biological crusts

Responsible participant: D. Aiyambo. Refer Aiyambo (2007).

Biological crusts and 'fensteralgen' were sampled on the transects that were made for arachnids (see below). At 15m intervals, a 0.25m² quadrant was placed on the substrate and all rocks within it were rolled over to check for the presence of fensteralgen. Presence or absence of a biological soil crust was noted.

Arachnids

Responsible participants: J. Henschel & D. Aiyambo. Refer Henschel & Aiyambo (2007).

Depending on the nature and size of each study area, either three or four line transects were established across each area to sample arachnids. The line transects were approximately 100 m long and they were placed approximately 50 m apart. Every 15 m along each transect we searched for arachnids within a diameter of 10 m. We searched by looking on the ground, under shrubs, under overhangs and turning over stones. Approximately 12 hours were spent actively searching each of the three sites in this fashion. Each site was classified into one of three microhabitats, namely i) wash (drainage line), ii) bedrock and rocky hillside, or iii) gravel plains. The substrate, slope and vegetation composition of these microhabitats is described elsewhere.

Arachnids were collected at first sighting. Signs of spiders (e.g. silk or egg cocoon) where the animal was not present were noted. Webs and burrows of common spiders (e.g. Agelenidae, Pholcidae, Sparassidae, Segestriidae) or sightings of common surface-active species (e.g. the gnaphosid spider *Asemesthes* sp., or scorpion *Parabuthus brevimanus*) were noted but only a few voucher specimens of each were collected. Specimens obtained from systematic searches along transects were supplemented by specimens collected in pitfall traps or casual traversing of the area by colleagues.

Scorpions were searched using a black-light at night along linear transects across low-lying areas of the study sites. For reasons of personal safety, hillsides (scree and bedrock) were not intensively searched, and for scorpions it is not possible from our study to make deductions of relative distribution across different microhabitats.

The current survey did not focus on the Acari (mites and ticks) and no attempt is made to assess their status. Similarly, although signs of pseudoscorpions

were observed during the current survey, the focus was not directed towards this group.

Collected specimens were identified to family level, and sometimes tentatively to species level (Lamoral 1979; Dippenaar-Schoeman & Jocqué 1997). The possible identity was sometimes inferred from previous records of arachnids from the Rössing area or surrounding areas. Although all species were only tentatively identified, we refer to some of the animals in this report by these tentative names.

Insects

Responsible participants: John Irish and Kaarina Eelu. Refer Eelu (2007).

Insects were sampled by sinking pitfall traps along river washes, and by placing yellow trays filled with anti-freeze on rocky slopes and alongside pitfall traps in the washes. All insects collected by any members of the team were brought in for identification in the field.

Reptiles

Responsible participant: R. Kavari. Refer Kavari (2007).

Reptiles were collected with ten 20cm-deep buckets sunk in the various habitats at each site. Sightings were recorded by all members of the team, and photographs were taken to help identification.

Birds

Responsible participant: J. Pallett. Were identified from calls and sightings.

Mammals

Responsible participant: J. Pallett. Small terrestrial mammals were not collected due to the low diversity that was found in the 1980s work. All signs and tracks of mammals, as well as a few skulls, were identified as far as possible. Mist-netting was done for bats but single bats were seen on only a few nights, showing that bat activity was in any case very low.

4. TAXONOMIC LISTING

To allow comparison, numbering follows that in the 1984/85 report. Given that 2007 fieldwork was limited in time and place, and happened at a non-ideal time of year, many of the 1984/5 taxa were not encountered.

4.4. Arachnida (eight-legged invertebrates)

4.4.1. Acari (mites and ticks)

Unidentified Acari (tiny mites) were found at the SK site, and also at Piet-se-gat.

4.4.2. Araneae (spiders)

4.4.2.1. Agelenidae (funnel-web spiders)

Agelena species were recorded from the SH and SK areas.

4.4.2.2. Ammoxenidae (termite-eating spiders)

Only recorded at the SH area.

4.4.2.9. Gnaphosidae (ground spiders)

Asemesthes species recorded from SH and SK areas.

4.4.2.16. Oecobiidae (flatmesh-weaver spiders, star-legged spiders)

Paroecobius species recorded from SH and SK areas.

4.4.2.21. Pholcidae (daddy long-legs spiders)

Smeringopus species recorded from SH and SK areas.

4.4.2.23. Salticidae (jumping spiders)

Unidentified Salticidae were recorded from SK and Dome areas.

4.4.2.25. Segestriidae (tube-web spiders)

Ariadna species were recorded from the SH, SK and Dome areas.

4.4.2.27. Sicariidae (violin spiders)

Sicarius species recorded from SH and SK areas.

4.4.2.28. Sparassidae (huntmen spiders)

Sparassidae were recorded from SH, SK and Dome areas. Attempts to identify specimens to genus proved problematical, and highlighted the unsatisfactory state of taxonomic knowledge of this important group in Namibia.

4.4.2.30. Theridiidae (comb-footed spiders)

The conspicuous absence of the normally abundant webs of these spiders at the three sample sites was specifically noted by Henschel & Aiyambo (2007).

4.4.2.34. Zodariidae (ant spiders)

Recorded only from the SH area.

4.4.4. Pseudoscorpiones (false scorpions)

Unidentified species found at SK.

4.4.5. Scorpionida (scorpions)

4.4.5.2. Buthidae

Hottentota conspersus was recorded from the SK area. This small scorpion was not recorded during the 1980's survey, possibly because of sampling method bias.

Parabuthus brevimanus was recorded from the SH and Dome areas.

Parabuthus namibensis was recorded from the SK area.

4.4.6. Solifugae (solifuges, sun spiders)

Unidentified species were found in the SK and Dome areas. Henschel & Aiyambo (2007) remarked on what they considered unusually low solifugid abundance.

4.5. Insecta (six-legged invertebrates, insects)

4.5.1. Blattodea (cockroaches)

Unidentified species were found in the SK and SH areas.

4.5.2. Coleoptera (beetles)

4.5.2.1. Anthicidae (ant beetles)

A *Notoxus* species was found in the Dome area.

4.5.2.2. Bruchidae (seed weevils)

Bruchidae were recorded in the SH area.

4.5.2.4. Carabidae (ground beetles)

Recorded in the SK, SH and Dome areas.

4.5.2.5a. Cleridae (chequered beetles)

Cleridae were not specifically recorded during the 1980's survey, and this may be because they are alate, or because clerids are relatively uncommon in Namibia anyway. In 2007, Cleridae were recorded in the SH area.

4.5.2.7. Curculionidae (snout beetles, weevils)

Unidentified species recorded in the SK and Dome areas.

A *Hyomora* species recorded in the Dome area.

4.5.2.12. Hydraenidae (moss beetles)

Recorded from the Dome area.

4.5.2.15. Melyridae (flower beetles)

Recorded in the SH area.

4.5.2.16. Monommidae (beetles, no common name)

Recorded in the SK area.

4.5.2.20. Tenebrionidae (toktokkies, darkling beetles)

Epiphysa species recorded in the SK and Dome areas.

Geophanus species recorded in the SK, SH and Dome areas.

Metriopus species recorded in the SK, SH and, Dome areas.

Physosterna species recorded in the SH area.

Rhammatodes species recorded in the SK, SH and Dome areas, and at Piet-se-gat.

Asphaltheistes species recorded in the SK and Dome areas. (*Asphaltheistes* was not recorded by the 1980's survey.)

Stenocara species recorded in the SK, SH and Dome areas.

Tarsoconodes species recorded in the SK area.

Zophosis species recorded in the SK and Dome areas.

Indeterminate Tenebrionidae species recorded in the SH area.

4.5.2.22. Coleoptera family indeterminate

Two indeterminate beetles recorded, one each from the SK and SH areas.

4.5.4. Diptera (flies and allies)

4.5.4.1. Asilidae (robber flies)

Recorded from the SH area.

4.5.4.2. Bombyliidae (bee flies)

Recorded from the SK, SH and Dome areas, also at Piet-se-gat.

4.5.4.6. Culicidae (mosquitoes)

Recorded from the SK area.

4.5.4.9. Hippoboscidae (horse flies)

Recorded from the SK area, and at Piet-se-gat.

4.5.4.9a. Muscidae (typical flies)

Recorded from the SK area. Though muscids are common flies, they were not specifically recorded by the 1980's survey, probably because they are alate.

4.5.4.10. Sarcophagidae (carrion flies)

Recorded from the SK and SH areas.

4.5.4.11. Tephritidae (fruit flies)

Recorded from the SH area.

4.5.6. Hemiptera (bugs)

4.5.6.1. Aphididae (aphids, plant lice)

Recorded from the SK and SH area, also at Piet-se-gat.

4.5.6.2. Cicadellidae (leafhoppers)

Recorded at the Dome area.

4.5.6.3a. Coccoidea (scale insects)

Recorded from the SH area, and Piet-se-gat. Not specifically recorded during the 1980's survey, probably because of sampling bias: coccids are stuck to plants, and as such do not get into pitfall traps.

4.5.6.4. Fulgoroidea (planthoppers)

Recorded from the SK and SH areas, also at Piet-se-gat.

4.5.6.5. Lygaeidae (seed bugs, ground bugs)

Recorded from the SK and Dome areas, also at Piet-se-gat.

4.5.1.1 Reduviidae (assassin bugs)

Recorded from the SK and SH areas.

4.5.7. Hymenoptera (bees, wasps, ants)

4.5.7.3. Apidae (honey bees)

Apis mellifera recorded from Piet-se-gat.

4.5.7.5. Formicidae (ants)

Camponotus maculatus recorded from the SK, SH and Dome areas, also at Piet-se-gat.

Crematogaster species recorded from the Dome area, also at Piet-se-gat.

Ocymyrmex species recorded from the SK, SH and Dome areas.

Unidentified small ant species were recorded from all sites.

None of the genera and species specified above is unexpected in the area, and they are probably identical to taxa recorded only as morphospecies during the 1980's survey.

4.5.7.5a. Masaridae (small wasps, no common name)

Recorded from the SK, SH and Dome areas. Masarids were not specifically recorded during the 1980's survey, probably because they are alate. Their presence in the area is not unexpected.

4.5.7.6. Mutillidae (velvet ants)

Recorded from the SH area, also at Piet-se-gat.

4.5.7.7. Parasitica (parasitic wasps)

Recorded from the SK, SH and Dome areas, also at Piet-se-gat.

4.5.7.8. Pompilidae (spider-hunting wasps)

Recorded from the SH area.

4.5.7.9. Sphecidae (sand wasps)

Recorded from the SK and SH areas.

4.5.7.9a. Vespidae (true wasps)

Recorded from Piet-se-gat. Vespidae were not specifically recorded during the 1980's survey, possibly because they are alate. Their presence in the area is not unexpected.

4.5.8. Isoptera (termites)

Hodotermes mossambicus was recorded from the Dome area.

4.5.9. Lepidoptera (butterflies and moths)

Unidentified Lepidoptera were observed in the SK and SH areas.

4.5.10. Mantodea (mantids)

Recorded from the SK and SH areas.

4.5.11. Neuroptera (lacewings and antlions)

Myrmeleontidae (ant lions) were recorded in the SK and SH areas.

4.5.13. Orthoptera (grasshoppers, locusts and crickets)

4.5.13.3. Gryllidae (crickets)

Mogoplistinae species were recorded from the SK area.

4.5.13.6. Schizodactylidae (feather-toed crickets)

Comicus species was recorded from the Dome area.

4.5.15. Psocoptera (book lice)

Psocoptera were recorded from Piet-se-gat.

4.5.17. Thysanoptera (thrips)

Recorded from all sampling sites.

4.5.18. Thysanura (silverfish, fishmoths)

Ctenolepisma species were recorded from the SK, SH and Dome areas.

Thermobia species recorded from the SK area.

4.6. Amphibia (frogs)

Griffin (pers. comm.) adds the following species to the two recorded by the 1980's survey.

- *Phrynomantis annectens*. Rubber Frog. Expected.

4.7. Reptilia (reptiles)

4.7.2. Chamaeleonidae (chamaeleons)

Chamaeleo namaquensis was recorded from the SH area.

4.7.3. Colubridae (snakes)

Psammophis notostictus. Karoo Whip Snake. Recorded from the Dome area.

Griffin (pers. comm.) added the following to the colubrids recorded during the 1980's survey.

- *Dasypeltis scabra*. Rhombic Egg-eater. Expected.
- *Psammophis leopardinus*. Leopard Whip Snake. Expected.
- *Pseudaspis cana*. Mole Snake. Expected.
- *Pythonodipsas carinata*. Western Keeled Snake. Expected.
- *Telescopus beetzii*. Namaqua Tiger Snake. Known to occur.

- *Telescopus semiannulatus*. Southern Tiger Snake. Expected.
- *Telescopus* new species. Damara Tiger Snake. Not yet described. Known to occur.

4.7.3a. Elapidae (cobras and allies)

Not recorded during the 1980's survey, but Griffin (pers. comm.) records the following from the area.

- *Naja nigricincta*. Zebra Snake.

4.7.4. Gekkonidae (geckos)

Ptenopus species recorded from the SH area.

Rhoptropus afer recorded from the SK, SH and Dome areas.

Griffin (pers. comm.) adds the following to the species recorded during the 1980's survey.

- *Pachydactylus rugosus*. Namibian Rough-scaled Gecko. Expected.
- *Ptenopus carpi*. Banded Barking Gecko. Expected.

4.7.6. Lacertidae (lizards)

Pedioplanis husabensis recorded from the SK, SH and Dome areas.

Griffin (pers. comm.) adds the following to the species recorded during the 1980's survey.

- *Meroles* new species. Recently identified east of Swakopmund and may eventually prove to occur in the Rössing area as well.
- *Pedioplanis inornata*. Namibian Sand Lizard. Occurs.

4.7.7. Leptotyphlopidae (worm snakes)

Griffin (pers. comm.) added the following to the species recorded during the 1980's survey.

- *Leptotyphlops labialis*. Damara Worm Snake. Expected.

4.7.8. Scincidae (skinks)

Trachylepis hoeschi recorded from the SK area.

Trachylepis variegata recorded from the SK, SH and Dome areas.

4.7.10. Viperidae (adders)

Griffin (pers. comm.) adds the following to the species recorded during the 1980's survey.

- *Bitis arietans*. Puff Adder. Expected.

4.8. Aves (birds)

Besides the species recorded during the 1980's survey, the following additional birds have been observed or may potentially occur in the area.

- *Aegypius tracheliotos*. Lappet-faced Vulture.
- *Afrotis afraoides*. Northern Black Korhaan.
- *Apus caffer*. White-rumped Swift.
- *Aquila pennatus*. Booted Eagle.
- *Ardeotis kori*. Kori Bustard.
- *Bubo capensis*. Cape Eagle Owl.
- *Buteo augur*. Augur Buzzard.
- *Buteo rufofuscus*. Jackal Buzzard.
- *Caprimulgus tristigma*. Freckled Nightjar.
- *Chalcomitra senegalensis*. Scarlet-chested Sunbird.
- *Chrysococcyx caprius*. Diderick Cuckoo.
- *Cinniricinclus leucogaster*. Violet-backed Starling.
- *Corythaixoides concolor*. Grey Go-away-bird.
- *Creatophora cinerea*. Wattled Starling.
- *Crithagra flaviventris*. Yellow Canary.
- *Cypsiurus parvus*. African Palm Swift.
- *Dendropicos fuscescens*. Cardinal Woodpecker.
- *Dendropicos namaquus*. Bearded Woodpecker.
- *Elanus caeruleus*. Black-shouldered Kite.
- *Estrilda erythronotos*. Black-faced Waxbill.
- *Falco chicquera*. Red-necked Falcon.
- *Falco naumanni*. Lesser Kestrel.
- *Falco peregrinus*. Peregrine Falcon.
- *Falco subbuteo*. Eurasian Hobby.
- *Glaucidium perlatum*. Pearl-spotted Owlet.
- *Hirundo cucullata*. Greater Striped Swallow.
- *Lanius minor*. Lesser Grey Shrike.
- *Merops apiaster*. European Bee-eater.
- *Muscicapa striata*. Spotted Flycatcher.
- *Myrmecocichla formicivora*. Anteating Chat.
- *Namibornis herero*. Herero Chat.
- *Neotis ludwigii*. Ludwig's Bustard.
- *Otus leucotis*. Southern White-faced Scops-Owl.
- *Passer motitensis*. Great Sparrow.
- *Philetairus socius*. Sociable Weaver.
- *Phylloscopus trochilus*. Willow Warbler.
- *Poicephalus rueppellii*. Rüppell's Parrot.
- *Polemaetus bellicosus*. Martial Eagle.
- *Pternistis adspersus*. Red-billed Spurfowl.
- *Quelea quelea*. Red-billed Quelea.
- *Rhinopomastus cyanomelas*. Common Scimitarbill.
- *Terpsiphone viridis*. African Paradise Flycatcher.
- *Tockus leucomelas*. Southern Yellow-billed Hornbill.
- *Tockus nasutus*. African Grey Hornbill.
- *Upupa africana*. African Hoopoe.
- *Urocolius indicus*. Red-faced Mousebird.

Additional water birds which may also potentially occur include:

- *Alcedo cristata*. Malachite Kingfisher.
- *Bubulcus ibis*. Cattle Egret.
- *Egretta garzetta*. Little Egret.
- *Egretta intermedia*. Yellow-billed Egret.
- *Phalacrocorax lucidus*. White-breasted Cormorant.
- *Pluvialis squatarola*. Grey Plover.
- *Scopus umbretta*. Hamerkop.

4.9. Mammalia (mammals)

Besides the rodents recorded during the 1980's survey, the following mammals were observed, or are expected to occur in the area.

- *Antidorcas marsupialis*. Springbok.
- *Atelerix frontalis*. Southern African Hedgehog. [Really?*
- *Canis mesomelas*. Black-backed Jackal.
- *Cistugo seabrai*. Namibian Wing-gland Bat.
- *Crocuta crocuta*. Spotted Hyaena.
- *Eidolon helvum*. Straw-coloured Fruit Bat.
- *Eptesicus hottentotus*. Long-tailed Serotine.
- *Equus zebra*. Namibian Mountain Zebra.
- *Felis lybica*. African Wild Cat.
- *Genetta felina*. Southern Small-spotted Genet.
- *Graphiurus rupicola*. Western Rock Dormouse.
- *Hipposideros caffer*. Sundevall's Leaf-nosed Bat.
- *Hystrix africae australis*. Porcupine.
- *Ictonyx striatus*. Striped Polecat.
- *Laephotis namibiensis*. Namib Long-eared Bat.
- *Lepus capensis*. Cape Hare.
- *Malacothrix typica*. Large-eared Mouse.
- *Miniopterus natalensis*. Southern Long-fingered Bat.
- *Nycteris thebaica*. Egyptian Slit-faced Bat.
- *Oreotragus oreotragus*. Klipspringer.
- *Oryx gazella*. Gemsbok.
- *Otocyon megalotis*. Bat-eared Fox.
- *Papio ursinus*. Chacma Baboon.
- *Petromus typicus*. Dassie Rat.
- *Procavia capensis*. Rock Dassie.
- *Proteles cristatus*. Aardwolf.
- *Raphicerus campestris*. Steenbok.
- *Rhinolophus darlingi*. Darling's Horseshoe Bat.
- *Rhinolophus denti*. Dent's Horseshoe Bat.
- *Sauromys petrophilus*. Flat-headed Free-tailed Bat.
- *Scotophilus dinganii*. Yellow House Bat.
- *Suricata suricatta*. Suricate.
- *Tragelaphus strepsiceros*. Greater Kudu.
- *Vulpes chama*. Cape Fox.

4.10. Micro-plants

Biological soil crusts were recorded in the SK, SH and Dome areas.

4.12. Plants

The 1980's botanical work has since been superceded by the work of Burke (2005) and Loots *et al.* (in progress).

APPENDIX C: Inventory of all assessed biodiversity taxa.

IUCN statuses: CR = Critically Endangered,
EN = Endangered,
VU = Vulnerable,
NT = Near-threatened,
LC = Least Concern,
NE = Not Evaluated,
DD = Data Deficient,
- = Alien, evaluation irrelevant.

Determination of IUCN status:

EOO = Extent of Occurrence (km²),
NOL = Number of Locations where recorded.

Habitat preference: RH = Rocky hillsides,
OP = Open plains,
WC = Watercourses
WC = Aquatic.

Endemicity: RA = Endemic to Rössing area,
CN = Endemic to Central Namib Desert (ca. Kuiseb - Ugab),
CW = Endemic to Central Western Namibia,
ND = Endemic to wider Namib Desert (Orange - Kunene),
NA = Endemic to geopolitical Namibia,
? = endemism indeterminate (higher categories, not identified to species),
Cell empty = Widespread (not endemic to Namibia)

Taxa are listed in the following order:

	<i>page</i>
Plants	2
Arachnids and other non-insect invertebrates	7
Insects	14
Reptiles and amphibians	28
Birds	30
Mammals	35

Taxa are listed by common name, Family or higher taxonomic grouping, and Genus and species.

Appendix D: Methodology used to derive a habitat categorization for the Rössing area

To analyse habitats for the Rössing Mining Licence Area and its surroundings (up to at least 10 km from the pit), we used a remote-sensing approach.

Habitat types as used here were derived from Landsat photography of the area at 30 m resolution. The orthophoto supplied by Rössing has a much finer resolution, but lacked essential components needed for habitat classification, notably an infrared band, therefore it could not be used. An area from 14.9 – 15.2°E and 22.3 - 22.6°S was looked at. The Landsat photo was analysed with Definiens eCognition software at level 20 discrimination by Mr. B. Strohbach, using settings that have proven useful for the delimitation of habitat types elsewhere in Namibia. The resultant 5073 polygons are shown in Figure J1.

Even though the principal components of the final map are already apparent in Figure J1, clearly this categorisation is too detailed to be of much practical use. Discrimination was therefore progressively relaxed to form larger categories, testing these against known conditions on the ground throughout, until an acceptable balance was found. Along the way, artefacts such as hill shadows that had initially been categorised as separate habitats, were fixed. The only subjectivity in the categorisation is the decision as to which level of consolidation to accept, and in this Mr. Strohbach was guided by his and project members' experience of the area. The final categorisation and resulting map is shown in Figure J2 and is included in the main report as [Figure](#)

A categorisation corresponding exactly to Burke's (2005) biotopes could not be found, but there is general agreement between the two results, as explained in the main report [Section ...](#)

Figure J1: First approximation (level 20 discrimination) habitat categorisation for the Rössing area.

Figure J2: Final categorisation of habitats after relaxation of the discrimination.

Comparison of habitat types as used here and biotopes as used in Burke (2005).

Why could we not just use the biotopes of Burke (2005) as is? Because the area of highest biodiversity data density and current highest interest, namely SK4, lies outside her 2005 study area. Her work included most of the 1980's survey sites and the many historical collecting sites along the adjacent main road, and some of the SK area. We needed to categorise a wider area, and the timeframe did not allow reapplying her methods at a larger scale.

The biotopes determined in Burke (2005) were based on a combination of landforms, distribution of characteristic plant species, and lithology. The report does not detail the methodology of determining scope and extent of biotopes, nor how these were applied to produce the resultant polygons on the biotope map.

Habitat types as used here were derived from Landsat photography of the area at 30 m resolution. The orthophoto supplied by RUL has a much finer resolution, but lacked essential components needed for habitat classification, notably an infrared band, therefore it could not be used. An area from 14.9 – 15.2°E and 22.3 - 22.6°S was looked at here. The Landsat photo was analysed with Definiens eCognition at level 20 discrimination by Mr. B. Strohbach, using settings that have proven useful for the delimitation of habitat types in Namibia. The resultant 5073 polygons appear below (Figure J-1).

Figure J-1:

Even though the principal components of the final map are already apparent above, clearly this categorisation is too detailed to be of much practical use. Discrimination was therefore progressively relaxed to form larger categories, testing these against known conditions on the ground throughout, until an acceptable balance was found. Along the way, artefacts such as hill shadows that had initially been categorised as separate habitats, were fixed. The only objectivity in the categorisation is the decision as to which level of consolidation to accept, and in this Mr. Strohbach was guided by his and project members' experience of the area.

A categorisation exactly corresponding to Burke's biotopes could not be found, but comparing the two schemes it becomes apparent that there is much correspondence between them. They simply categorise the environment at two different scales, and the high degree of mutual correspondence increases the confidence in both.

Table J-1.

Burke (2005) biotopes	Current habitat types
1. <i>Aloe asperifolia</i> plains	Plains
2. <i>Arthroerua luebnitziae</i> plains	
16. <i>Zygophyllum stapfii</i> plains	
3. Central hills	Hills and mountains
4. Eastern hills	
5. <i>Euphorbia virosa</i> belt	
8. Khan River mountains	
9. Marble hill	
10. Marble ridge	
10. Marble ridge	
10. Marble ridge	
11. Northern dome	
13. South-western hills	
15. Western granite hills	
6. Gorges	Watercourses
7. Khan River	
12. Plain drainage lines	Plains + Watercourses
14. Undulating granite hills	Plains + Hills

The overlay of the Strohbach map and Burke's biotope map (Figure J-1) shows precise agreement in delineation of the Khan River and general agreement in the 'hills and mountains' and 'plains' habitats. The main points of difference between the two schemes are:

- Strohbach's habitat classification shows that the plains are not homogenous, but include numerous, low rocky ridges. Experience bears this out.
- Strohbach's classification does not distinguish minor watercourses from the habitat they flow through.

Figure J-2: Overlay of Burke's biotope map on Strohbach's habitat map derived from Definiens eCognition software.

Map needs lat long

APPENDIX D. Application of IUCN evaluation criteria to Rössing species.

The World Conservation Union (IUCN) maintains global Red List data. It defines Red List categories, as well as the evaluation criteria to be followed before red listing a species (IUCN 2000, 2005). The Terms of Reference for the biodiversity assessment expect that species occurring in the Rössing area be ranked by IUCN category.

Formal IUCN categorisation is not available for the bulk of Namibian biota. Only mammals (Griffin & Coetzee 2006) and some endemic plants (not all plants, or even all endemic plants) (Loots 2005) have been evaluated using the latest IUCN criteria. Unpublished reptile evaluations using the newest criteria were kindly made available by the MET biologist, Mr. Mike Griffin. No evaluations are available for Namibian invertebrates, or, strangely enough, birds (excepting those few species occurring in Namibia that have been evaluated on a global level). The bulk of biodiversity at Rössing is concentrated in the invertebrates, and IUCN categorisation criteria were newly applied to them here.

Since different suites of information are available for different taxa, IUCN (2005) offers five different entry points into the categorisation process. Categorisation is ultimately a reflection of species demographics, therefore four of the five criteria (numbers A, C, D and E) are exclusively concerned with population sizes and trends. This information is simply not available for Namibian invertebrates. The fifth criterion (number B, specifically B1) incorporates different information, and was used here.

To use criterion B1, information on the following 3 factors is needed:

1. Extent of occurrence of species in km²
2. Number of locations from which the species has been recorded
3. Directional trends in any of:
 - a. Extent of occurrence
 - b. Area of occupancy
 - c. Area, extent or quality of habitat
 - d. Number of locations or subpopulations
 - e. Number of mature individuals

Full instructions for using criterion B1, and definitions of terminology, are available in IUCN (2005), but in short it means that:

- if a species has an extent of occurrence of less than 20000 km²
- and is known from 10 or less locations,
- and there is evidence of continued decline or extreme fluctuations in any one of factors 3 a-e in the previous paragraph,

it will evaluate to a Threatened status.

For present purposes, if a species had a limited extent of occurrence that includes the Rössing area (factor 1), and a limited number of known localities

(factor 2), it was taken as a given that the requirements of factor 3 had also been complied with. Past mining activities had undoubtedly led to declines in some or all of factors 3 a-e. This can best be illustrated for taxa that are known only from the Lower Dome sampling site, which is now covered by waste rock. Those species have undoubtedly suffered a decline in the area, extent and quality of their habitat, in the species population size, in their extent of occurrence and/or occupancy, and in the number of known locations (which are now minus one). The same would be true in future for any taxa that currently inhabit areas that will be impacted by habitat destruction in the form of open pits, waste rock dumps, roads, tailings facilities, leaching operations, associated mining infrastructure, and distance effects (dust, noise, vibrations, seepage etc.). For taxa that did not comply with factors 1 and 2, factor 3 was not considered, and they received a non-Threatened status, specifically 'Least Concern'. Current data resolution does not allow distinction between 'Least Concern', 'Near Threatened' and 'Data Deficient'.

The particular kind of Threatened status is determined by the actual values for extent of occurrence and number of locations as follows:

- extent of occurrence < 100 km², or known from a single locality only = Critically Endangered B1a(ii)b(a-e)
- extent of occurrence < 5000 km², and/or known from 5 or less locations only = Endangered B1a(ii)b(a-e)
- extent of occurrence < 20000 km², and/or known from 10 or less locations only = Vulnerable B1a(ii)b(a-e)

The designation 'B1a(ii)v(a-e)' specifies the criteria used, is the correct and complete way to cite an IUCN Threatened status, and should be read as implicit in any Threatened status designations elsewhere in this document.

Practical application of the above principles took place as follows: Known locations were gathered from the cited literature, supplemented by unpublished museum records and fieldwork results from the current study. Species known from more than 10 locations, and/or with an area of occupancy clearly larger than 20000 km² (about 140 x 140 km) were considered to have evaluated to Least Concern. For the rest, area of occurrence was calculated by first plotting known locations on a base map of Namibia, using Golden Software's Didger® v. 3.04. To allow for accurate subsequent area measurements a Lambert Azimuthal Equal Area Projection with standard parallel of -22 and central meridian of 17 was used.

IUCN recommends the calculation of a convex hull for the locations through the use of Delauney triangulation, followed by discarding of lines longer than twice (2x) the average line length in order to address potential population isolates. These methods are clearly intended for taxa that are more data rich than the Rössing invertebrates. At their most rudimentary, a minimum of three locations (one triangle) are required for triangulation, and a minimum of six points (two triangles) are needed to identify a single isolate. Many taxa evaluated here did

not even reach these minima. Under the circumstances, the shortest line connecting and/or including all points was used to construct a polygon representing the area of occurrence. In the light of limited information, no testing for population isolates was done (even if any had been identified, it would not have changed the number of species of concern that needed to be flagged here - it would only have increased the threat level of that particular taxon). The area of the occurrence polygon, in km², was read from the screen. This, plus number of localities were used to arrive at an IUCN category. Species known from only two locations were a particular problem, since an area of occurrence cannot be calculated for them. They were conservatively evaluated as Endangered on the basis of number of locations, even though an evaluation of Critically Endangered might have been more appropriate in those cases where the locations are proximate enough to imply an area of occurrence < 100 km².

Locations and polygons for all such evaluated species are available as Didger® project files [on the accompanying CD](#), and the resultant IUCN categorisations are listed in Table *.

Since a number of Threatened categorisations have been based on single specimen occurrences, it is justified to ask how significant such categorisations are. The following case study is presented in an effort to clarify the issues involved.

Case study: *Moggridgea eremicola*, a spider known from a single specimen found in a pit trap at the no longer extant Lower Dome Gorge survey site, and categorised as Critically Endangered here.

Question 1: What is the probability that *M. eremicola* is widespread in the Rössing area, but rare, hence only recorded once?

M. eremicola was found in a pit trap. During the 1983/84 Rössing survey, a total of 51 preservative pit traps were deployed at six sites for 420 continuous days = 21420 trap days. A total of 62691 specimens of 269 apterous invertebrate species were collected. (This is not the total number of invertebrates collected in the traps: the rest were alate, and were not counted; estimated to be at least as many again). One specimen out of 62691 is rare, yes. What about being widespread?

Specimens (apterous invertebrates only) were not equally distributed among the sites, as the following table shows:

	Dome	Stockpile	UpOstr	Arandis	LowOstr	Panner
Specimens	3738	10653	4156	6599	7520	29925

The Lower Dome trap site recorded the lowest number of invertebrates, possibly because it consisted of 6 traps only, while all the other sites had 9 traps each. If *M. eremicola* were widespread throughout the sampled area, albeit rare, one would rather expect it at one of the sites where more traps were deployed, and where more specimens were collected, not at the site with the least number of traps and least number of specimens. It follows that the occurrence of *M. eremicola* at Lower Dome probably represents a preference by this species for the biotope present at Lower Dome, rather than that at any of the other sites. It is probably not widespread in the Rössing area.

Question 2: what is the probability that *M. eremicola* is widespread elsewhere in Namibia, and was only recorded once at Rössing because it is at the extreme edge of its distribution range there?

Many similar preservative pit trap surveys have been done at various other places in Namibia over the years. Most of the material collected ended up in the National Museum of Namibia, yet no other specimens of *M. eremicola* have been recorded before or since the Rössing project. Large and long-term preservative pit-trapping surveys are known from a transect between Gobabeb and Windhoek (Endrödy, 1970's), Richthofen and Excelsior in the Windhoek area (Penrith and Louw, late 1970's), Kanaan in the southern Namib and Wildheim in the southern Kalahari (Louw, Ph.D. study, late 1970's), Gocheganas near Windhoek and Chulon near Kalkrand (Penrith, early 1980's), six sites in Etosha (Darwin project, early 1990's) and a transect up the Brandberg (late 1990's). Besides these, numerous 72-hour pit trap surveys have been done all over the country by the National Museum over the years, while a pit-trapping survey has been running at Gobabeb continuously for 20 + years. In the same time span, several foreign museums have launched major collecting expeditions in Namibia, of which the largest were the British Museum (1970's), South African National Collection of Insects (1980's, Central Namib), and the Berlin Museum (1990's). Major earlier collections include the Transvaal Museum's Carp expeditions (1950's), Swedish Museum, Lund (1950's), Smithsonian Institution (1930's), South African Museum (1920's) and Michaelsen and Schulze's expeditions (early 1900's). Among the hundreds of thousands of invertebrates collected by them, not a single specimen of *M. eremicola* was found. It follows that it is unlikely that *M. eremicola* is widespread in Namibia, and it is probably restricted to the area where it was found.

Question 3: What is the possibility that there are *M. eremicola* specimens in the previously mentioned material from elsewhere, but they have been misidentified, or just not recognised?

Moggridgea belongs to the primitive (mygalomorph) spiders, which includes better known groups like tarantulas and baboon spiders. Mygalomorphs, even the smaller bodied ones like *Moggridgea*, are distinctive and easily recognisable with the naked eye. The first step when identifying a random batch of spiders, is

to split any mygalomorphs from the bulk of non-mygalomorph spiders. Mygalomorphs are seen seldom enough that any will be noticed. They are unlikely to have been mistaken for anything else.

Question 4: Assuming *M. eremicola* is restricted to the biotope that was found at the former Lower Dome sampling site, how far beyond this area could it conceivably occur?

Since no information is available on the habitat requirements of *M. eremicola*, the answer to this question must be based on conjecture.

Worst case scenario: *M. eremicola* was originally restricted to the SJ area only and the open pit has destroyed all available habitat. Lower Dome was a marginal habitat, and the species was already on the verge of extinction when the 1980's specimen was collected there. It has since died out. If not, it is truly Critically Endangered as the categorisation process has suggested.

Best case scenario: *M. eremicola* occurs in habitats similar to that at Lower Dome, elsewhere in the Rössing area. Rocky hills of the kind that occurred at Lower Dome are found on both sides of the Khan River valley, but the surrounding plains are unsuitable habitat, putting northern and southern limits on the potential distribution area. In the Namib, there is a steep east-west gradient in most climatic parameters, putting eastern and western limits on the distributions of most biota. There is a definitive faunal turnover between 30 and 40 km from the coast, at the point where average average annual fog precipitation approximately equals average annual rainfall. Some conspicuous Central Namib invertebrates, e.g. the 'white' tenebrionid beetle, *Cauricara eburnea*, are common west of this line, but absent to the east – no *C. eburnea* were seen during the Rössing survey. Towards the east, there is another faunal turnover between 70 and 80 km from the coast (in this part of the Namib – different distances elsewhere), where the Desert Biome is replaced by the adjacent Nama-Karoo Biome. It follows that the maximum plausible range for a Lower Dome biotope specific taxon might be a 10 km wide strip centered on the Khan River, from the Swakop confluence upstream as far as the Valencia area.

Average case scenario: The truth is probably somewhere between the above two extremes. The best case scenario gives an area of occurrence of ca 500 km² (10km x 50 km), which, given sufficient localities, would evaluate to Endangered, rather than Critically Endangered. However, given that the area range for the Endangered category is 100 to 5000 km², it is clear that a species with an area of occurrence of only 500 km² is close to the lower limits of the category. Bear in mind that Rössing's current operations and the existing extensive stone quarrying in parts of the area have already reduced suitable habitat within this (best case scenario) 500 km² area, and that Rössing's planned extensions as well as the planned Valencia Mine will reduce this even further. It follows that, even if the species were found to be more widespread, and if it were to evaluate

to Endangered rather than Critically Endangered, the difference would be mere semantics from the species' viewpoint.

Question 5: Since more information in the form of more records of a species from more localities (and from a larger area of occurrence) can cause a species to be re-evaluated to a lower threat status, what is the possibility of doing more sampling for *M. eremicola* and thereby proving that it is not as threatened as current information seems to suggest?

This is possible, but not simple. At least one specimen would need to be recorded from each of 11 additional localities within the suggested 500 km² range before *M. eremicola* can be evaluated to a non-Threatened category. Taking what we know as a guide, an average of 2520 trap days (6 traps x 420 days, the operational span of the Lower Dome site) would be needed at each locality. Assuming each selected locality is successful (which is not a given), this equates to 27720 trap days, which is more effort than was required by the original Rössing survey.

It is worth noting that such an exercise would carry a considerable logistical burden. Besides physical trapping, trap contents would need to be sorted, identified, preserved and curated into the future. Current Namibian capacity to do this has declined since the 1980's, and is limited.

Question 6: Assuming that additional sampling can cause *M. eremicola* to evaluate to a lower threat status, can this not also result in additional, previously unknown and highly Threatened species being found, thereby defeating the object of the exercise?

Yes. This is almost guaranteed. Biodiversity follows a logarithmic distribution. In any ecosystem the bulk of species will be of average abundance, but then there will be a very few that are extremely common, and a great many that will be extremely rare. Continued sampling will expend ever greater amounts of effort to record ever more, ever rarer species. While more sampling may cause the current Threatened status of some species to be re-evaluated, it will almost certainly also replace them with other, newly discovered, Threatened species.

This does not mean that additional sampling cannot be useful, just that one should determine beforehand what the desired result is and whether more sampling will achieve that result.
